

Roundtable on reimbursement and payment of health apps

Tatjana Trupec and Petra Hoogendoorn

Agenda – 3rd Roundtable on reimbursement of health apps

Part 1. Introduction 09:30 –10:20

- a. **Label2Enable (and) recommendations on the reimbursement of health apps - Petra Hoogendoorn, Leiden University Medical Center (LUMC)**
- b. **Strengthening health systems by recommending and prescribing health apps in PHC – Antoni Dedeu, Senior Advisor in Integrated Primary Health Care, WHO Europe**
- c. **Towards the European Health Data Space – Ole Gjerrestad, Policy officer DG SANTE**
- d. **What is the role of EU level legislation in the pathway to health and wellness apps reimbursement – Petra Wilson, HIMSS *Break 5min***

Part 2. Decision-makers' perspectives on the reimbursement of health apps 10:25 – 11:15

- a. **Humber and North Yorkshire (ORCHA) – Carrie Cranston, Digital Programme Manager, NHS Humber and North Yorkshire Integrated Care System**
- b. **Croatia – Siniša Varga, former Minister of Health and former Director of the National Health Insurance Fund in Croatia**
- c. **Catalonia – Jordi Piera Jiménez, Director of the Digital Health Strategy Office at the Catalan Health Service**
- d. **Portugal – Henrique Martins, Professor, ex. President of the Board of eHealth authority Ministry of Health Portugal**

Part 3. Discussion 11:15 – 12:30

- a. **Discussion: Recommendations on the reimbursement of citizen / patient-facing health apps – Tatjana Prenda Trupec moderating**
 - b. **Conclusion of all 3 roundtables – Petra Hoogendoorn, Leiden University Medical Center (LUMC)**
-

Part 1. Introduction

- a. Label2Enable (and) recommendations on the reimbursement of health apps
- b. Strengthening health systems by recommending and prescribing health apps in PHC
- c. Towards the European Health Data Space
- d. What is the role of EU level legislation in the pathway to health and wellness apps reimbursement

a. Label2Enable (and) recommendations on the reimbursement of health apps

3rd roundtable on reimbursement and payment of patient / citizen-facing health apps –
February 13, 2024

how to distinguish a 'good' health app?

App Store Preview

mySugr - Diabetestracker-log

Suggesties voor jou

Wyatt (2018) How can clinicians, specialty societies, and others evaluate and improve the quality of apps for patient use?

Larsen et al (2019) Using science to sell apps: Evaluation of mental health app store quality claims

Singh et al (2016) Many health apps target high-need, high-cost populations, but gaps remain

the context: EU policy

- The *Green Paper on mobile health* (2014) addresses the potential benefits and risks of health apps, questioning **how to verify or ensure the efficacy of health apps** (e.g. certification schemes) and **how to better inform users** on the quality and safety of these apps
- The *Communication on enabling the digital transformation of health and care in the Digital Single Market* (2018) highlights “digital tools and data for citizen empowerment and person-centred care” as a key priority and proposes **common principles and certification** to facilitate supply of these tools, also by Small and Medium-sized Enterprises
- *CEN-ISO/TS 82304-2:2021 (health and wellness apps – quality and reliability)*, an assignment from the European Commission to the European Committee for Standardization (CEN), International Organization for Standardization (ISO) and the International Electrotechnical Commission (IEC), delivers a **common health app assessment framework and label**
- The Proposal for a *Regulation on the European Health Data Space* (2022) calls for **voluntary labelling of wellness apps** (Article 31) and a **cascading effect in medical devices** that aim to be interoperable with Electronic Health Record systems
- *Horizon Europe project Label2Enable* creates **ISO 17067 EU certification scheme** for CEN-ISO/TS 82304-2 aligned with EU values and EU legislation, enabling accredited app assessors (third party assessment) to issue **trusted CEN-ISO/TS 82304-2 health app quality labels, scores and reports**

Annex II

1. General requirements

1.1. achieve the performance intended by its manufacturer and designed and manufactured such that, during normal conditions of use, it is suitable for its intended purpose and its use does not put at risk patient safety.

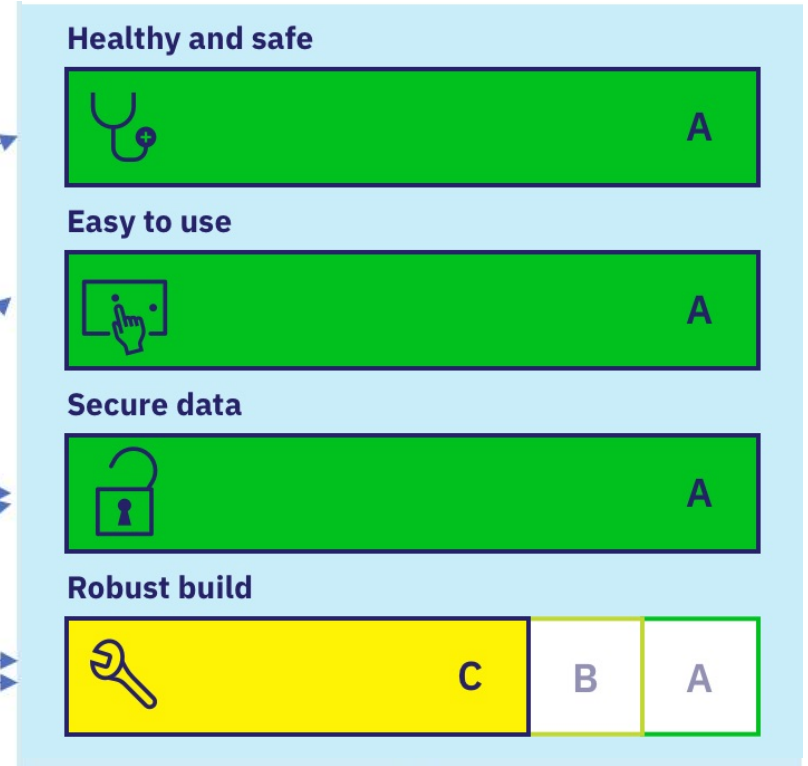

1.2. designed and developed that it can be supplied and installed, taking into account the instructions and information provided by the manufacturer, without adversely affecting its characteristics and performance during its intended use.

1.3. designed and developed in such a way that its interoperability, safety and security features uphold the rights of natural persons.

1.4. designed and manufactured in such a way that interoperability and compatibility are reliable and secure, and personal electronic health data can be shared with the EHR system.

2. Requirements for interoperability

3. Requirements for security

mHealth Hub (2022) Health App Assessment Frameworks

draft recommendations for reimbursement of apps

1. **Govern** – Establish governance: who within the health authority is responsible for exploring and decision-making on assessment and reimbursement of health apps?
2. **Value** - Acknowledge **apps can do things that pills can't and vice versa**. Both in their own way potentially contribute to health, wellbeing and can impact citizen, patient, carer and overall burden of the health system. Assess both the positive value and potential adverse effects or risks of apps, whether integrated in hybrid care pathways or not, for your public health and health system, now and in the future. Examples may include advances in prevention, early diagnosis, patient self-management, treatment adherence, health literacy, health professional efficiency, cost-effectiveness, primary and secondary data. Adverse effects, for which assessment can be a mitigation, may span privacy and security, regulatory compliance, user engagement, disparities, and technology lifetimes.
3. **Focus** - Identify types of apps that can deliver this value for specific health issues in which care pathways and if applicable for which types of patients. Evaluate these apps for potential payment or reimbursement in these care pathways.
4. **Assess** – Establish a framework for assessing health apps through internal processes or outsourcing. Consider incorporating a trusted EU framework within your own additional national requirements, creating an accelerated more efficient assessment. Ensure the assessment results are easily accessible, also to patients and citizens (e.g. label in frequently used trusted sources).
5. **Create** - Create the environment in which apps can deliver value. Integrate properly evaluated high-quality health apps in care pathways to maximize their value and facilitate potential substitution or cost reduction. If the value requires a role of a health professional, fund that role. Facilitate and provide incentives for industry to deliver quality products, addressing present and future needs. Ensure that reimbursement rates consider added value, quality, societal benefits, investments needed to acquire the indicated evidence, sustained equitable use, seamless integration of app data in EHRs, etc. and enable further investments to meet future demands. Set up the needed infrastructure. Enable interoperability and safe data exchange between EHR systems and patient-facing health apps. Use standards.
6. **Fund** – Foster reimbursement of quality apps, making them part of a new normal and accessible to all. Allocate related funds, consider innovative payment models, and explore need for further policies.
7. **Specify** - Recognizing that if you judge an app by its ability to be a pill or vice versa we will believe either one is stupid, explore and communicate appropriate outcome measures and potentially also comparators (standard of care, if possible with an EU perspective, waiting list, other digital / hybrid care) and scope to consider (e.g. wider value of behaviour change and literacy) to capture the true value and thus make adequate decisions on initial and final reimbursement. Consider that beyond individual benefit, apps can progress societal benefit with the data they produce for secondary use.
8. **Enable** – Promote the education of health care professionals (medical school, post-graduate, Massive Open Online Courses, also by professional societies and manufacturers). This education should include how to analyse app data to safely capture the value of data in primary use and ultimately secondary use. Educate citizens and patients on benefits and risks associated with health apps and how to recognise trusted sources.
9. **Support** – Co-create a support role for patients and consumers similar to pharmacists for drugs and consumer organisations for consumer products, alongside efforts from manufacturers to create easy to use apps and of insurers and hcps to require and reward such ease of use. Involve professional societies to provide guidance for health professionals on how to identify apps to recommend and their recommended use, also in relation to other health interventions. Integrate this guidance in regular clinical guidelines.
10. **Measure** – Measure value transparently. Publish reports and explore what else needs to be arranged to capture the attainable value of health apps. Enable and incentivise such results. Realise that without quality apps, integrated in care pathways, users trained and resulting data being used, adequate outcome measures and ditto scope, etc. the measurements do not reflect attainable value.

reviewing a health app is difficult too

 - 5.2.4.5 health benefit
 - 5.2.5.1 societal benefit

aim 80-90-95% generic vs context-specific quality

Table 1: Mapping of assessment domains to ISO 82304-2 Health software — Part 2: Health and wellness apps — Quality and reliability standard

PROPOSED ASSESSMENT DOMAIN	ISO 82304-2:2021	NOTES
Acceptability User, cultural and health professional acceptance that the app is suitable for its intended purpose.	Not included	This domain has been added to ensure alignment to the needs of the Australian health and wellbeing ecosystem including health care needs, intended users, models of care and our diverse multicultural population.
Safety and trust The app is free from unacceptable risk, the information included can be trusted and implications of using the app are transparent to the intended user.	Healthy and Safe	There is a strong alignment in these areas. Some of the risk measures are recommended for implementation in a later version of the Assessment Framework as medium to high risk assessment is covered by TGA. This will allow time for the assessing organisation to mature.
Ease of use The app is designed and delivered in such a way that it is accessible and usable by its intended users.	Ease of Use	
Privacy and security The app is designed and delivered to secure it from threats, complies with Australian Privacy legislation and processes personal data only with consent.	Secure Data	Privacy and Security has been modified to reflect Australian legislation and standards with the addition of Consent Management and User Control as requested by stakeholders.
Technical quality assurance The app is developed using best practices and is technically robust and, where relevant, can successfully exchange data using Australian recognised standards.	Robust Build	This has been modified to reflect Australian standards and the maturity of the app developers and assessing organisation.

- reduced assessment if already an 82304-2 label

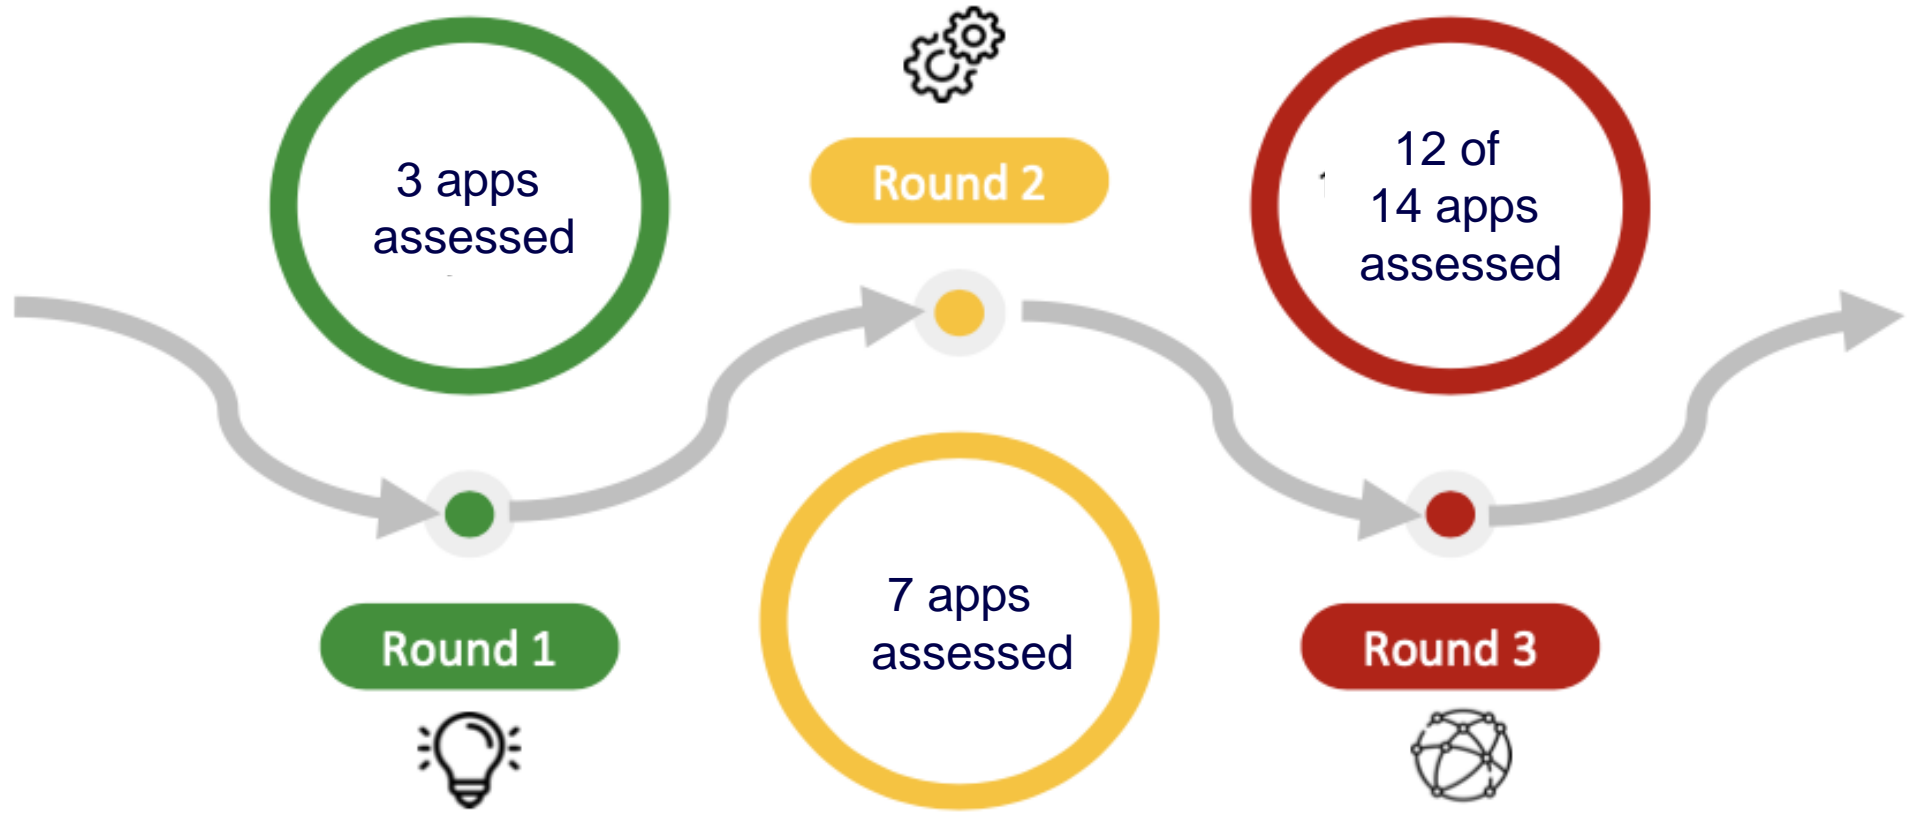

Phase 1: Triage

Basic information on the app and app developer is collected. This is used to determine:

- whether the app is eligible for assessment
- whether the app qualifies for a streamlined (that is, reduced) assessment because it complies with other regulations or standards such as:
 - TGA regulation
 - ISO 82304-2 Health software — Part 2: Health and wellness apps — Quality and reliability
- the complexity of the app, which will inform the type of assessment criteria and measures it will be assessed against.

testing the scheme: 5 CABs, 3 rounds, 24 apps

Digital Health and UHC

PERSPECTIVE

Prioritizing integrated mHealth strategies for universal health coverage

Geert Huisman¹ and Anshu Lakshana²

An evidence-driven approach to universal health coverage, enabled through technology-enabled health systems, can support the expansion, integration, and sustainability of health services with limited resources. Digital health systems and regulatory systems will enable better monitoring of the coverage of essential interventions for vulnerable and underserved target populations. A cascading model is proposed for prioritizing and operationalizing the role of integrated health strategies.

The goal of universal health coverage (UHC) is ensuring that all people, irrespective of socioeconomic status, should have access to health services that meet, without incurring financial hardship, their needs, including the 3rd United Nations Sustainable Development Goals (SDG) 3.6 (halving global road deaths and injuries) and 3.9 (halving global road deaths and injuries). The 2015 World Health Report and a 2017 United Nations General Assembly Resolution (U.N. A/RES/71/114) emphasize the need for digital health to ensure the delivery of health services and quality of care, often incorporating health-related data and analytics to improve the performance of health systems. Creative financing and governance arrangements may affect how best health services are delivered, but are unlikely to do so at the scale required to meet the millions who need care to experience an improved and dignified quality of life, and not use of, affordable quality services.

However, for these benefits to be realized, health systems need to be ready to integrate digital health technologies (DHTs) into existing health systems, independently of the global health or development interventions (often to assist) from and resources toward. The ability of these digital health systems to connect, integrate, and analyze data is a key to providing meaningful health services and addressing the needs of vulnerable populations (Fig. 1). In health systems, implementation strategies to scale up and integrate public health interventions of various other health or economic, environmental, and digital health interventions, including bringing together various stakeholders with different perspectives, is a critical challenge.

Digital health systems are beginning to address the production of health services, guided by evidence demonstrating their benefits, but

¹Department of International Health, Johns Hopkins University, Baltimore, Maryland. ²Department of International Health, Johns Hopkins University, Baltimore, Maryland. Correspondence: Geert Huisman (g.huisman@jhmi.edu)

DOI: 10.1126/science.1261111

Fig. 1. mHealth DHTs can help programs to provide early child vaccinations. (Photo: UNICEF)

with, ensuring the efficacy of health strategies (2). However, most of these strategies remain limited to their approach, that is, addressing single problems faced by health systems. A framework to help prioritize investments and operationalize the integration of health systems, where the range of quality care for clients is often contingent on several preceding issues of existing conditions. Knowing who is in need of services, being the necessary human resources and capabilities to deliver health, and ensuring these services at the right time and place are critical to UHC. Government agencies have been able to integrate innovations that help with some of these challenges, such as those being discussed in the articles open, perhaps by using the information and communication technologies (ICT) to help address some of these challenges.

Over the past decade, there has been a growing focus on digital health systems. However, we propose a cascading model for prioritizing and operationalizing the role of integrated health strategies. This model is based on the idea that digital health systems can help address some of the challenges of UHC, but are unlikely to do so at the scale required to meet the millions who need care to experience an improved and dignified quality of life, and not use of, affordable quality services.

However, for these benefits to be realized, health systems need to be ready to integrate digital health technologies (DHTs) into existing health systems, independently of the global health or development interventions (often to assist) from and resources toward. The ability of these digital health systems to connect, integrate, and analyze data is a key to providing meaningful health services and addressing the needs of vulnerable populations (Fig. 1). In health systems, implementation strategies to scale up and integrate public health interventions of various other health or economic, environmental, and digital health interventions, including bringing together various stakeholders with different perspectives, is a critical challenge.

Digital health systems are beginning to address the production of health services, guided by evidence demonstrating their benefits, but

with, ensuring the efficacy of health strategies (2). However, most of these strategies remain limited to their approach, that is, addressing single problems faced by health systems. A framework to help prioritize investments and operationalize the integration of health systems, where the range of quality care for clients is often contingent on several preceding issues of existing conditions. Knowing who is in need of services, being the necessary human resources and capabilities to deliver health, and ensuring these services at the right time and place are critical to UHC. Government agencies have been able to integrate innovations that help with some of these challenges, such as those being discussed in the articles open, perhaps by using the information and communication technologies (ICT) to help address some of these challenges.

DOI: 10.1126/science.1261111

Fig. 3.4.3. Health system needs for universal health coverage.

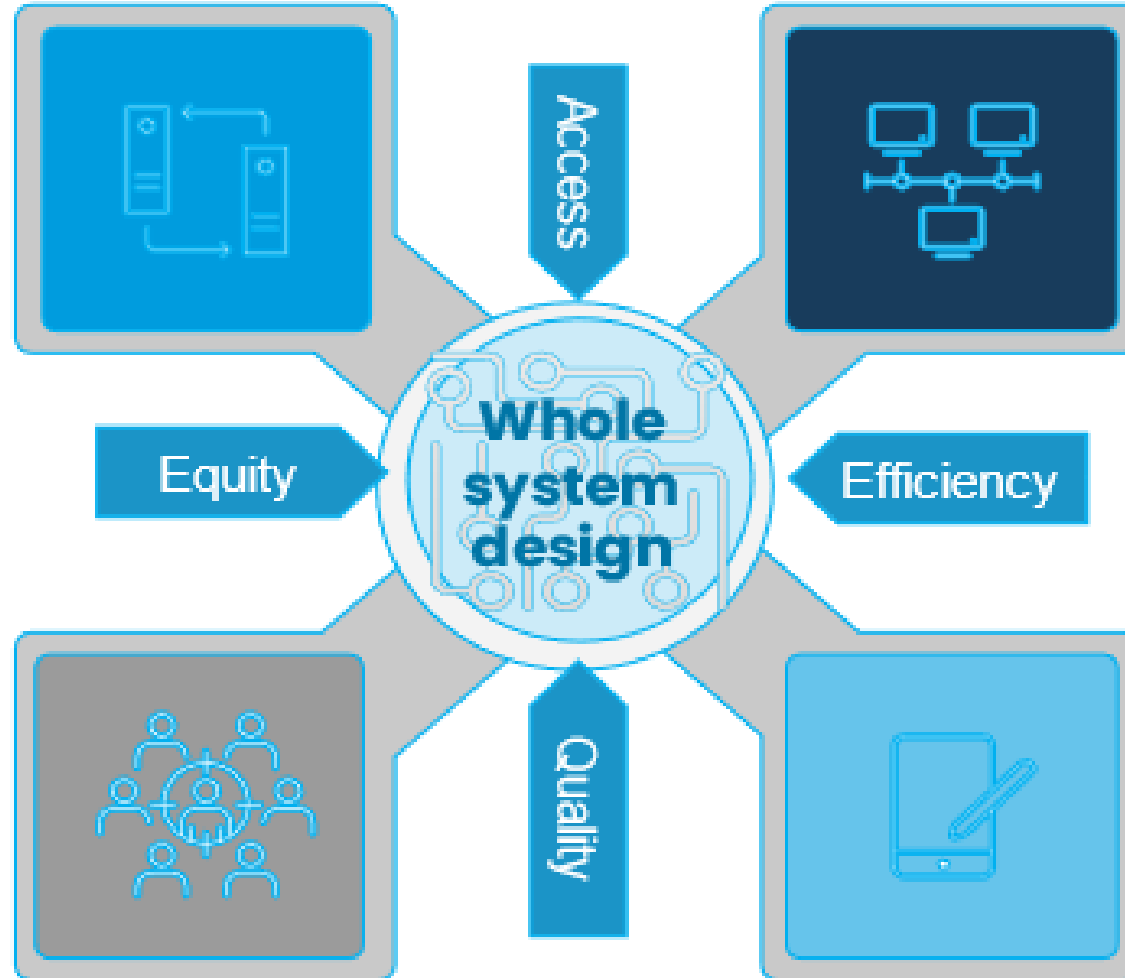

- ACCOUNTABILITY COVERAGE:** the proportion of those in the target population known and registered in the health system
- ACCESSIBILITY AND AVAILABILITY OF SERVICES:** includes ensuring availability of commodities, equipment and human resources and accessibility to health facilities
- CONTACT COVERAGE:** proportion of clients who have contact with relevant facilities, health workers and services among the target population
- COURTINUOUS COVERAGE:** the extent to which clients receive the full course of intervention required to be effective
- EFFECTIVE COVERAGE:** the proportion of individuals receiving satisfactory health services among the target population

PHC strengthened with integrated digital solutions

Remote service delivery Telemedicine & Telehealth

Telehealth and telemedicine solutions grounded in PHC

Interprofessional EHR

Shared electronic inter-professional medical records to support multi-disciplinary PHC

Tools to identify high risk and vulnerable

Population health management and risk stratification tools

SELF-MANAGEMENT

Digital self-management tools and technologies

Bringing services closer to people

How can multiple platforms be combined to reduce inequalities in access to health care and improve quality?

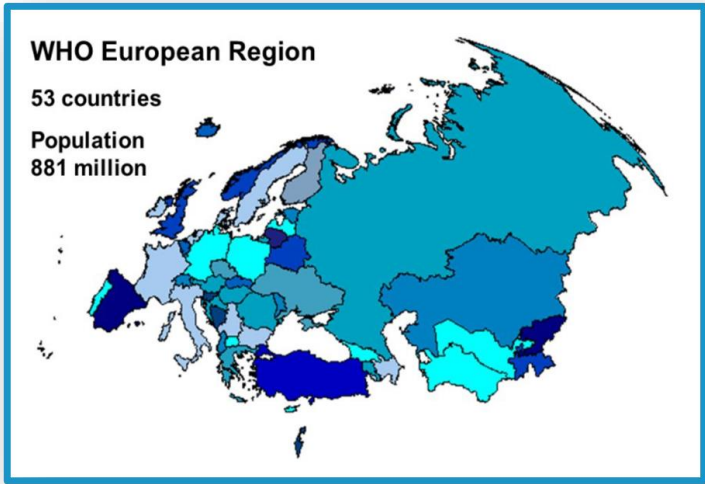

Chapter 3. The pillars of transformation	
This chapter is divided into six parts	
Part 1: the leaders – national digital health governance	Presents the significance of national digital health strategies and policies in unlocking the potential of digital health. This part of the chapter is informed by Strategic Priority 1 of the Digital Health Action Plan for the WHO European Region 2023–2030 and focuses on aspects like accessibility, quality, safety and efficiency, in addition to health information sharing and interoperability. Additionally, it emphasizes the role of national government agencies in supervising the uptake and application of digital health, the availability of funding, and the promotion of health literacy and digital inclusion.
Part 2: the lifelines – electronic health records (EHRs)	Carries forward the discussion on EHRs, touching upon the specificities of their use and implementation.
Part 3: bridging distances – telehealth	Delves into the utilization and advancement of telehealth services in the face of the recent pandemic. It expounds on the use of telehealth across Member States, reporting on national strategies, evaluations and barriers to telehealth implementation. It also examines the impact of the COVID-19 pandemic on the initiation or enhancement of telehealth services.
Part 4: health in your hands – mobile Health (mHealth) and mobile health applications (mApps)	Describes the role of mHealth and mApps in delivering various health services. It assesses the regulatory measures, challenges and impacts of the pandemic on the commencement or improvement of mHealth services.
Part 5: the power of knowledge – big data and advanced analytics for health	Reviews the employment of big data and sophisticated analytics in health services, as well as the challenges and regulations surrounding them.
Part 6: sharing is caring – access to and sharing of data	Data assesses the approaches Member States have employed to enable access to and sharing of health data, with a focus on privacy protection and control over health data.

Health in your hands

Mobile health (mHealth) and Mobile health applications (mApps)

Considerations to help move forward

1. Establish effective **governance**
2. Develop robust **evaluation guidelines** and increase **digital health literacy**
3. Ensure **sustainable financing** and **collaboration**
4. Address **interoperability** and **standardise** health data
5. Promote **patient-centred care** and **digital inclusion**

For Member States of the WHO European Region the geographic subregions are as defined by the United Nations Statistics Division and used in all United Nations publications and databases

**WHO European Region
 Member States by
 Subregion**

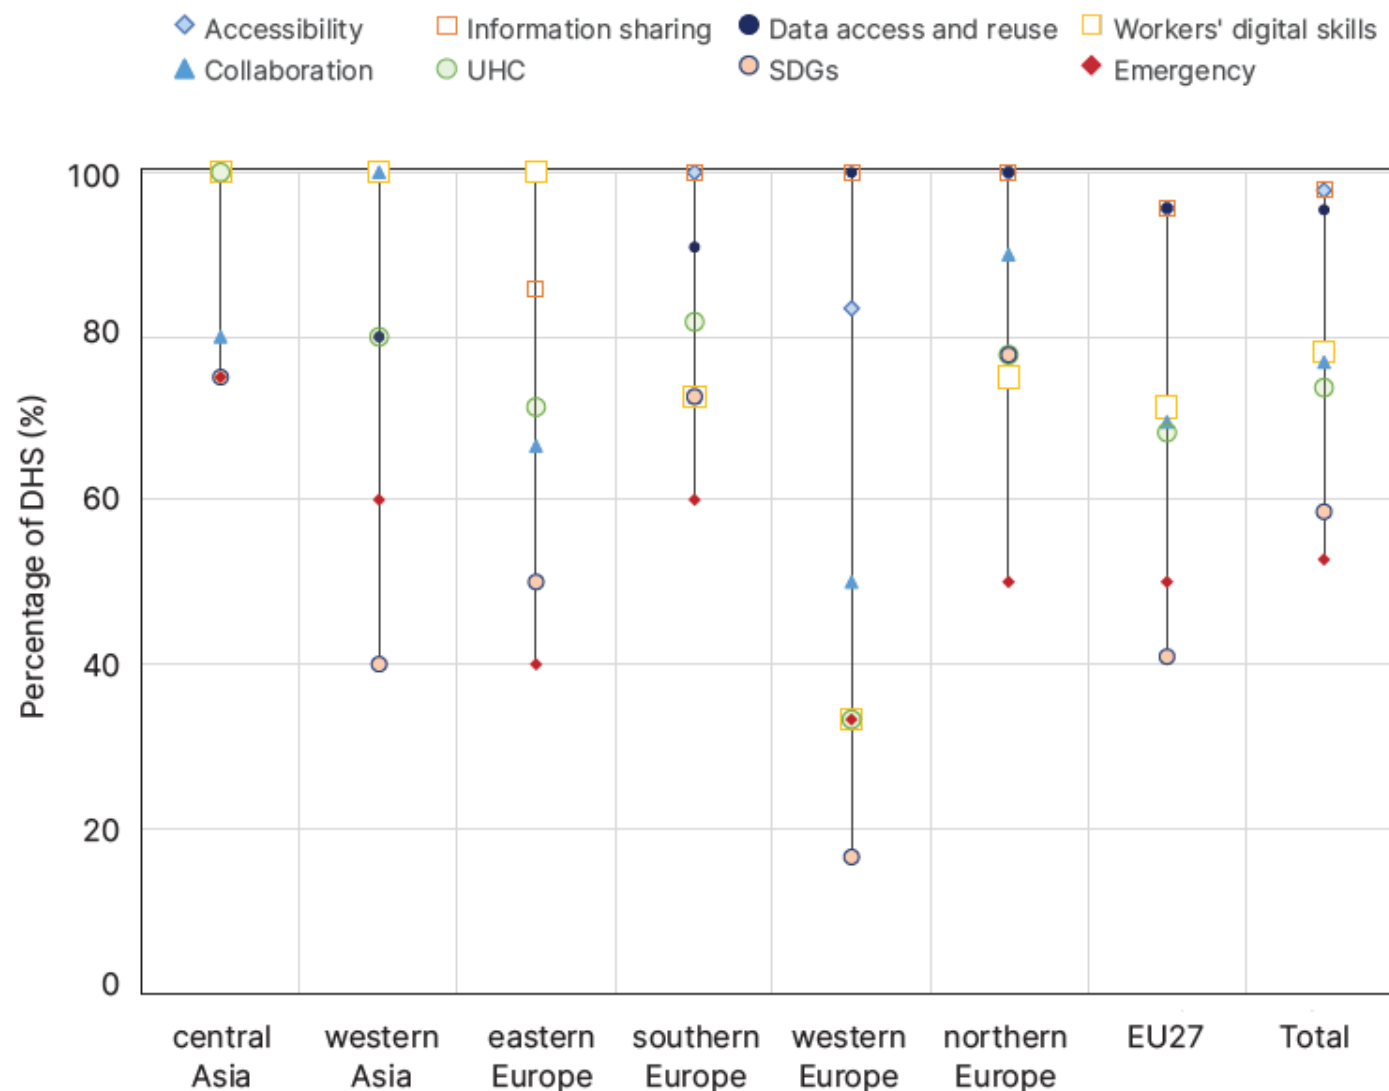

Subregion	Member States
central Asia	Kazakhstan, Kyrgyz Republic, Tajikistan, Turkmenistan, Uzbekistan
western Asia	Armenia, Azerbaijan, Cyprus, Georgia, Israel, Türkiye
eastern Europe	Belarus, Bulgaria, Czechia, Hungary, Poland, Republic of Moldova, Romania, Russian Federation, Slovak Republic, Ukraine
northern Europe	Denmark, Estonia, Finland, Iceland, Ireland, Latvia, Lithuania, Norway, Sweden, United Kingdom
southern Europe	Albania, Andorra, Bosnia and Herzegovina, Croatia, Greece, Italy, Malta, Montenegro, North Macedonia, Portugal, San Marino, Serbia, Slovenia, Spain
western Europe	Austria, Belgium, France, Germany, Luxembourg, Monaco, Netherlands (Kingdom of the), Switzerland

Member States with policies or strategies addressing digital health and HISs, by subregion

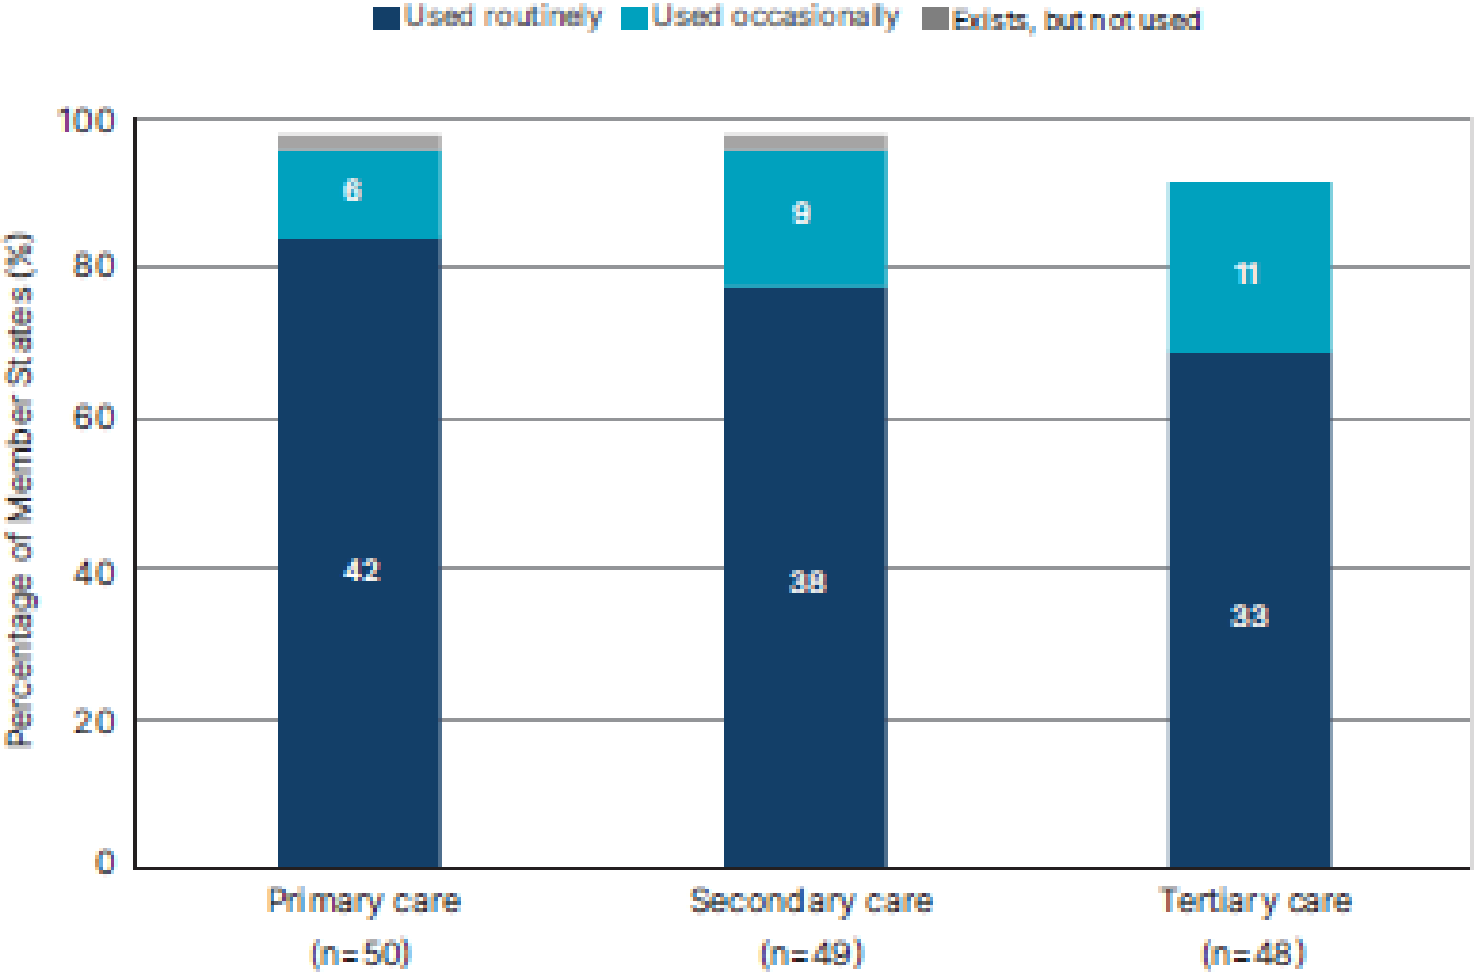

- ☐ **28** had developed a dedicated or stand-alone **DHS**
- ☐ **16** reported that their **DHS** was addressed within the scope of their national health strategy or policy or broader digital strategy
- ☐ **21** had developed a dedicated or stand-alone **HIS**
- ☐ **21** **HIS** within a national health strategy

Priorities mentioned in national DHS by subregion

Use of EHR systems in primary, secondary and tertiary health care

Special funding allocation during the COVID-19 pandemic

Note: the number of responding Member States varies for telehealth and data sharing.

Out of **47** responding Member States

34 reported having allocated **Special funding** to extend telehealth services during the pandemic

45 responding Member States

33 for **data-sharing** and **data interoperability platforms**

Many Member States introduced **new telemedicine services** and **schemes to pay** for them, which did not previously exist.

mHealth projects introduced or improved during the COVID-19 pandemic by type

Notes: "Do not know" responses are included in both numerators and denominators; denominators consist of the number of Member States where the services were implemented.

Examples of digital technologies used in the COVID-19 pandemic

COVID-19 context	Example technologies
Awareness, prevention and tracking	<ul style="list-style-type: none"> • Apps and websites for risk communication and dissemination of public health information • COVID-19 dashboards, mapping and forecasting utilities • Social media-based chatbots and online community forums • Case management software for contact tracing • Digital contact tracing apps • Infodemic management tools • Voluntary reporting tools • Self-management tools
Diagnosis, diagnostics and therapeutics	<ul style="list-style-type: none"> • Symptom assessment apps and online utilities • AI-based remote vital signs monitoring using devices or smartphone cameras • AI-powered computerized tomography imaging interpretation tools • Temperature-based diagnostic screening for border control
Management of contacts with the health system	<ul style="list-style-type: none"> • Online chat triage services • Online or app-based access to polymerase chain reaction test results • Telehealth or telemedicine use in primary health care
Surge management and protection in hospital settings	<ul style="list-style-type: none"> • Intensive care unit surge simulation tools • Inventory resource mapping and supply chain management tools • Telemedicine use in intensive care settings • E-learning platforms for health-care worker orientation • Robots (for disinfection, isolation ward communication and companionship, and medical waste transfer) • Volunteer databases
Testing and research	<ul style="list-style-type: none"> • Support to accelerated testing regimes • AI support to adaptive clinical trials
Recovery and re-establishment	<ul style="list-style-type: none"> • Smart vaccination certificates • Augmented reality-based temperature monitoring in public spaces

Source: (2).

mApps

Awareness, prevention and tracking

Diagnosis, diagnostics and therapeutics

Management of contacts with the health system

91% of Member States (38 out of 42) reported having at least one government-sponsored mHealth programme.

91% Government sponsored mHealth programme

The COVID-19 pandemic had a significant positive impact on the introduction and improvement of existing mHealth services.

67 % of Member States (31 out of 46) have established mHealth services providing access to an EHR.

67% The COVID-19 pandemic had a significant positive impact

72% of Member States (34 out of 47) reported not having an entity that is responsible for the regulatory oversight of mApps for quality, safety and reliability.

15% Only 15% of responding MS (6 out of 39) reported evaluation of mHealth programmes sponsored by the government.

Only 15% of responding Member States (six out of 39) reported the evaluation of government-sponsored mHealth programmes.

72% 34 out of 47 MS reported not having an entity responsible for the regulatory oversight of mApps for quality, safety and reliability

Percentage of Member States that reported at least one government-sponsored mHealth project by subregion

Note: central Asia is not included in the figure as only one Member State replied to this question.

Most common types of mHealth programmes

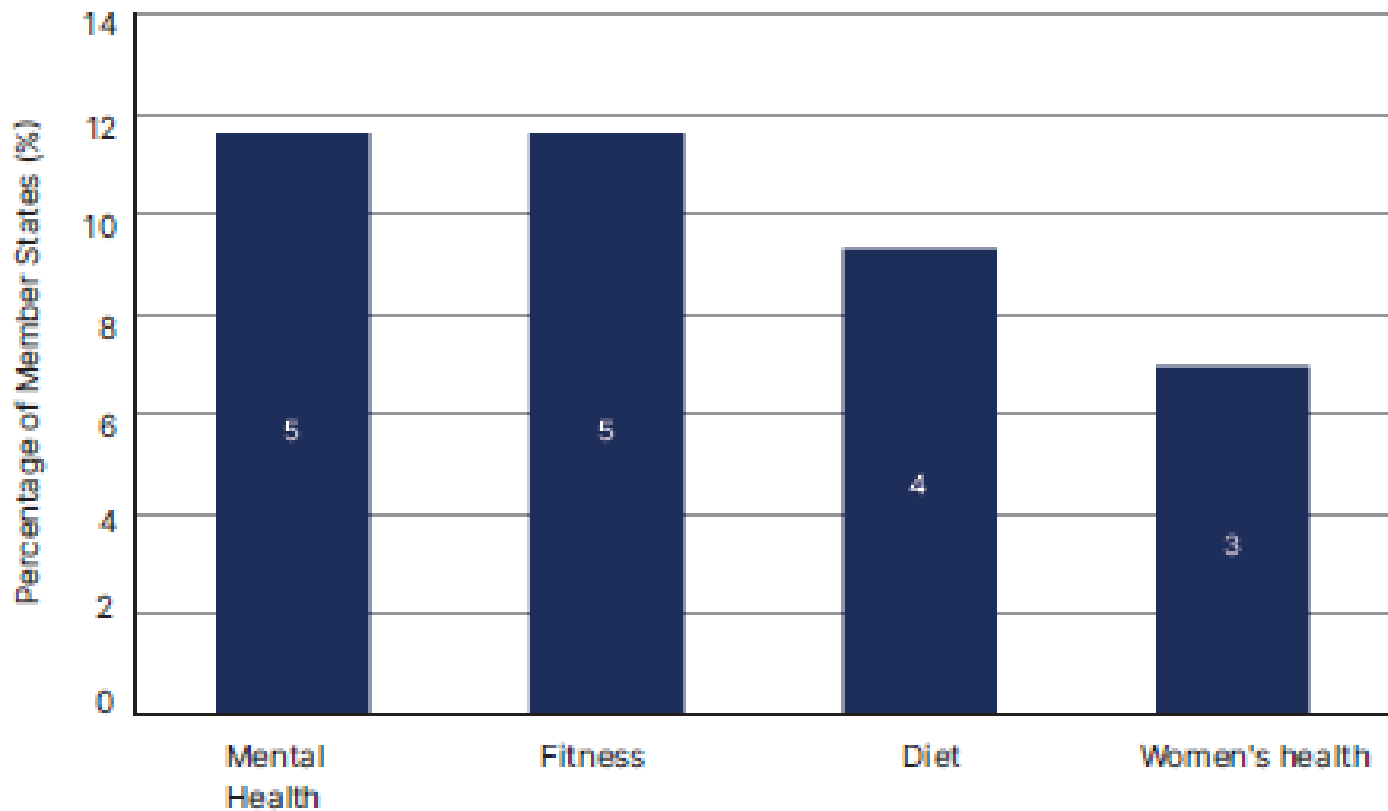

Incentives and guidance for innovation and research on mApps by subregion

Barriers to mApps integration into clinical practice by subregion

Types of mApps evaluated and approved (n=43)

Considerations

- ❑ Member States should consider **establishing entities** for mApp regulation and ownership security and privacy
- ❑ The **evaluation** of mHealth programmes and Apps should become the norm rather than the exception
- ❑ **Policy strategies** are needed to support the regulatory environment. National mHealth policies, strategies and regulations should be in line with those international
- ❑ Member States should have **national entities to promote the training** of health professionals, as well as of patients and citizens, to foster beneficial use of mHealth solutions

Thank you!

c. Towards the European Health Data Space

European Health Data Space

Roundtable on reimbursement of health apps
13 February 2024

Ole Gjerrestad
Policy officer DG SANTE
ole.gjerrestad@ec.europa.eu

Why act now?

- **The 2020 European Strategy for Data** announced the Commission's plans for European data spaces, including EHDS
- The COVID-19 pandemic has clearly demonstrated **the importance** of digital services in the health domain, and has triggered **an important acceleration in the uptake** of digital tools. The European Digital Covid Certificate – positioned the EU as a **global leader and standard setter in digital health**
- The challenge now is **to maintain this momentum** on the importance of health data

Proposal for a Regulation on the European Health Data Space

It sets out rules, common standards, infrastructures and a governance framework for the use of electronic health data for healthcare, research, innovation and policy making

Empower individuals to access and control their personal health data (Chapter II)

Ensure a consistent framework for the use of individuals' health data for research, innovation, policy-making and regulatory activities (Chapter IV)

Secondary uses of health data

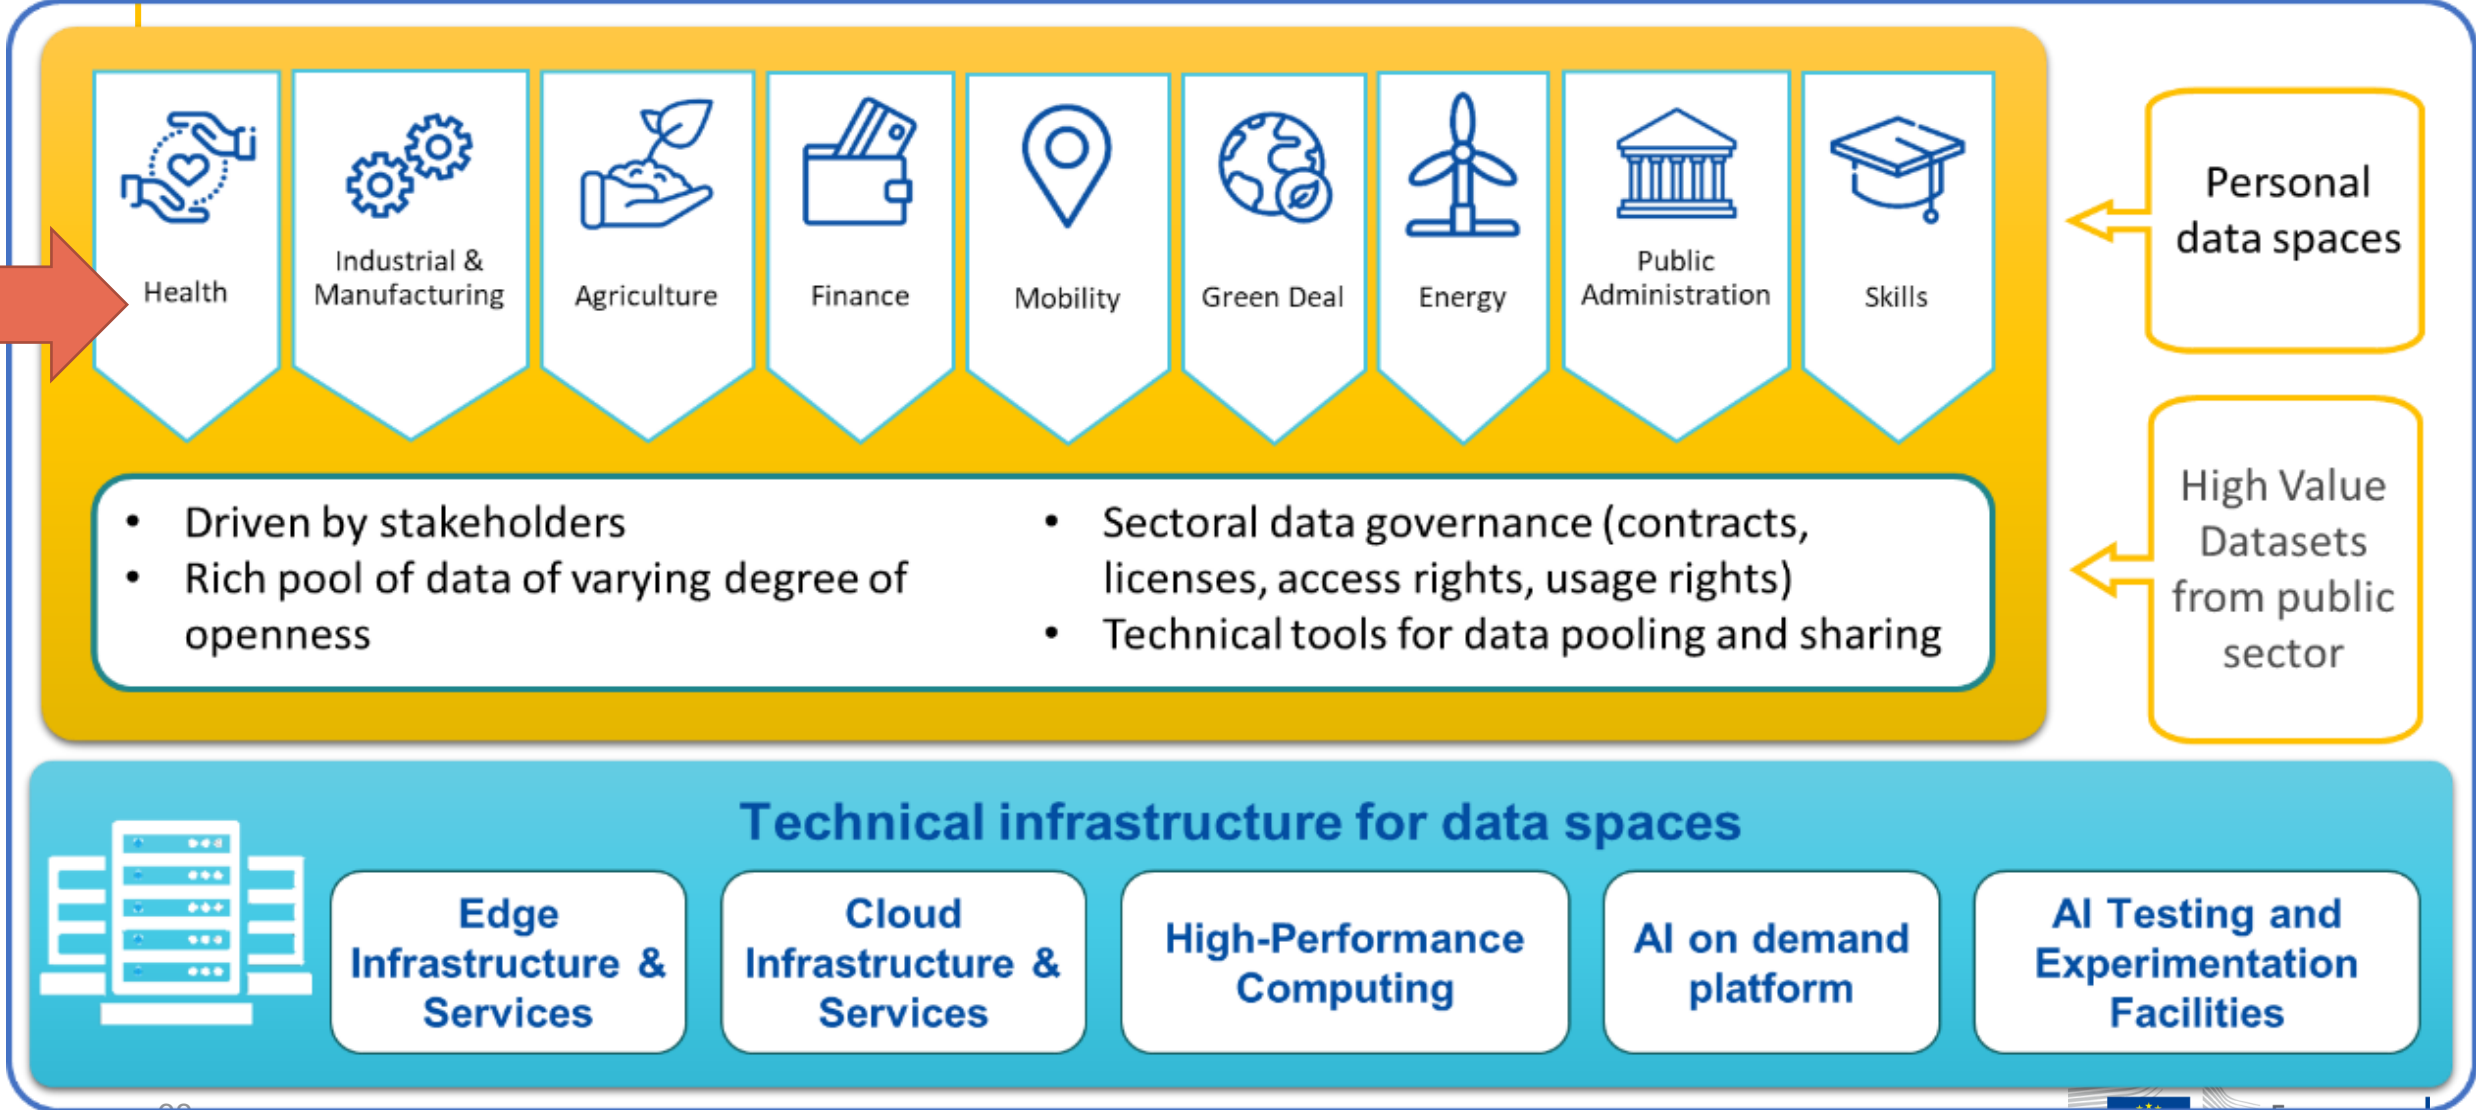

Primary uses of health data

Unleash the data economy by fostering a genuine single market for digital health services and products (EHR systems) (Chapter III)

Legal basis and scope of health data

- **Legal basis - Article 16 TFEU and Article 114 TFEU**
- **Article 16-** EHDS is building upon GDPR, strengthening the rights to the protection of personal health data and building on possibilities of EU law for processing sensitive health and genetic data
- **Article 114** - EHDS aims to improve the functioning of the internal market and the free movement of goods and services to avoid legislative fragmentation in the internal market and different rules and practices across the EU
- **Full respect of Article 168 TFEU** – EHDS does not intervene in organisation and delivery of health services and medical care of Member States

EHDS – the first sector specific European Data Space

EHDS and wellness applications

Definition in the context of European Health Data Space

‘wellness application’ means any appliance or software intended by the manufacturer to be used by a natural person for processing electronic health data for other purposes than healthcare, such as well-being and pursuing healthy life-styles;

Article 31 in CH III of the EHDS proposal

Where a manufacturer of a wellness application claims interoperability with an EHR system (C) **in relation to the harmonised components** of EHR systems and therefore compliance with the essential requirements laid down in Annex II and common specifications in Article 23, such wellness application (C,P) ~~may~~ shall be accompanied by a label, clearly indicating its compliance with those requirements. The label shall be issued by the manufacturer of the wellness application, (P) **and the competent market surveillance authority shall be informed.**

- Harmonized components are (1) interoperability (priority categories) and (2) logging
- When a manufacturer claims interoperability, it **must** use the label
- The label must be **registered** in the database of the competent market authority

- C- Council
- P - Parliament

Implementing EHDS - Joint action on primary use (EX-EHR)

Scope of Work Package 8 in JA09 Ex-Ehr

- Establish Assessment Framework: Develop a framework for assessing the interoperability of EHRs, personal health data spaces, and wellness applications.
- Prepare Guidelines for Wellness Apps: Provide guidelines for app developers based on EHDS regulations and ISO/TS 82304-2.
- Evaluate Previous Initiatives: Assess results from previous initiatives (e.g., Label2Enable, EuroCAS) to inform the development of guidelines and assessments.

Primary use of health data

MyHealth@EU

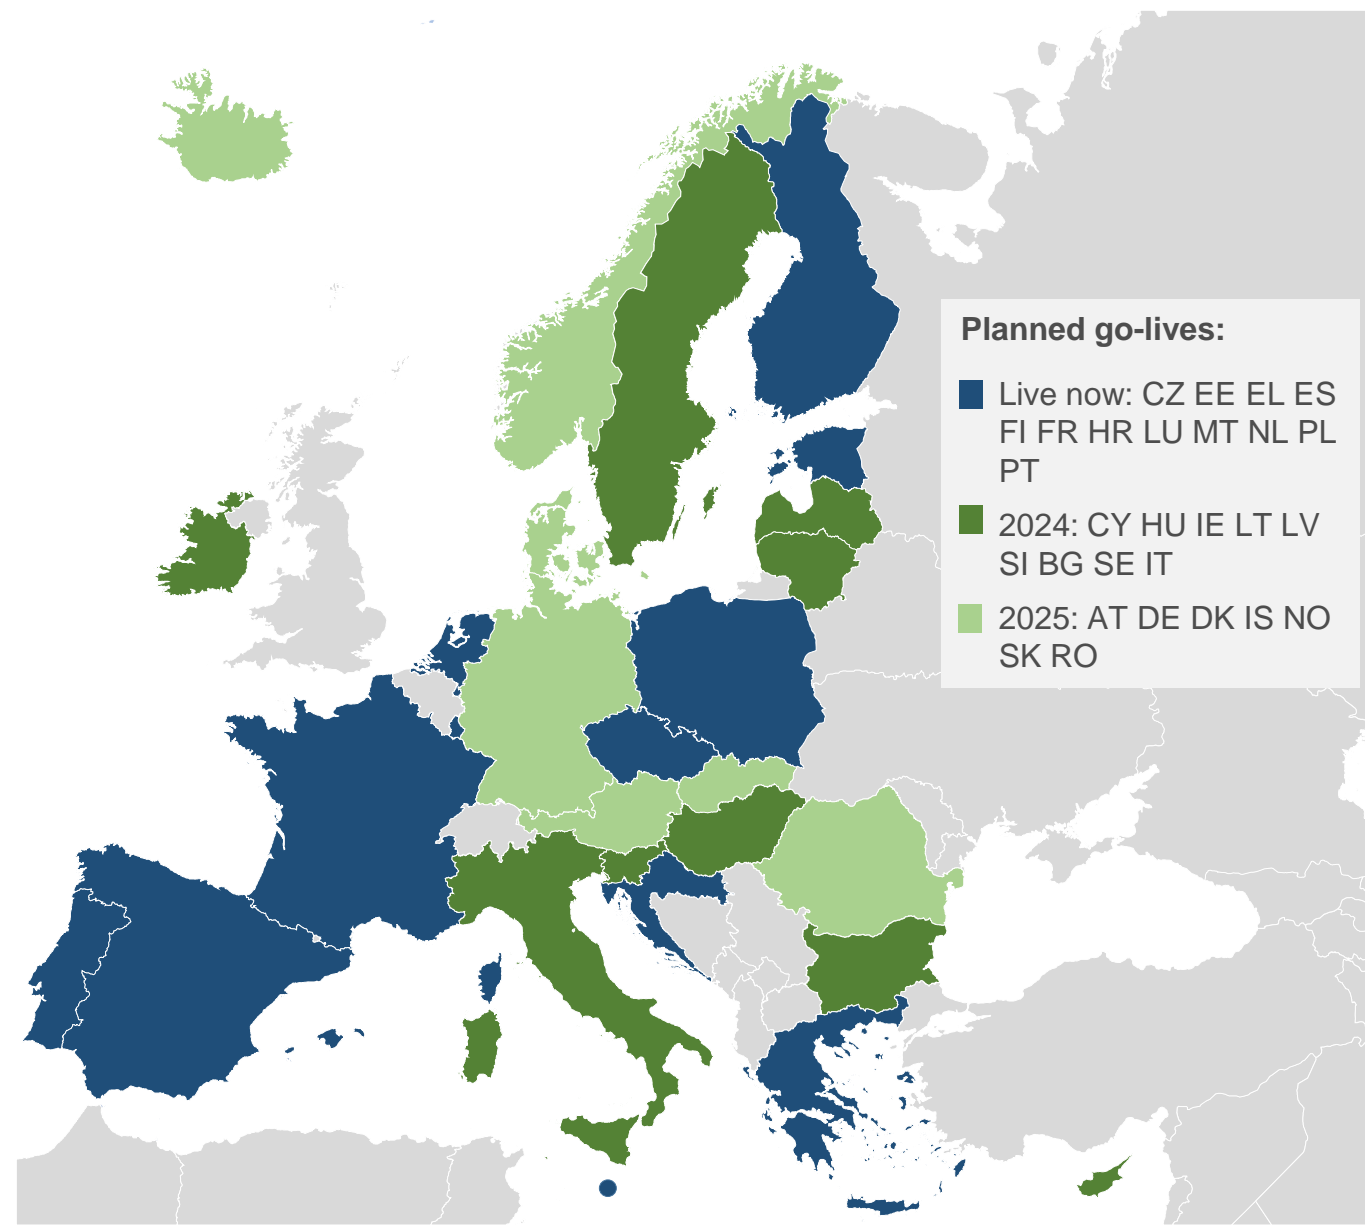

MyHealth@EU is the existing infrastructure that connects healthcare providers in 12 Member States.

The current live services are

(1) Patient Summaries and (2) ePrescriptions.

These services will be expanded to include (3) lab results, (4) hospital discharge reports and (5) medical images.

Together they comprise the priority categories in EHDS.

Cross-border electronic prescription in action

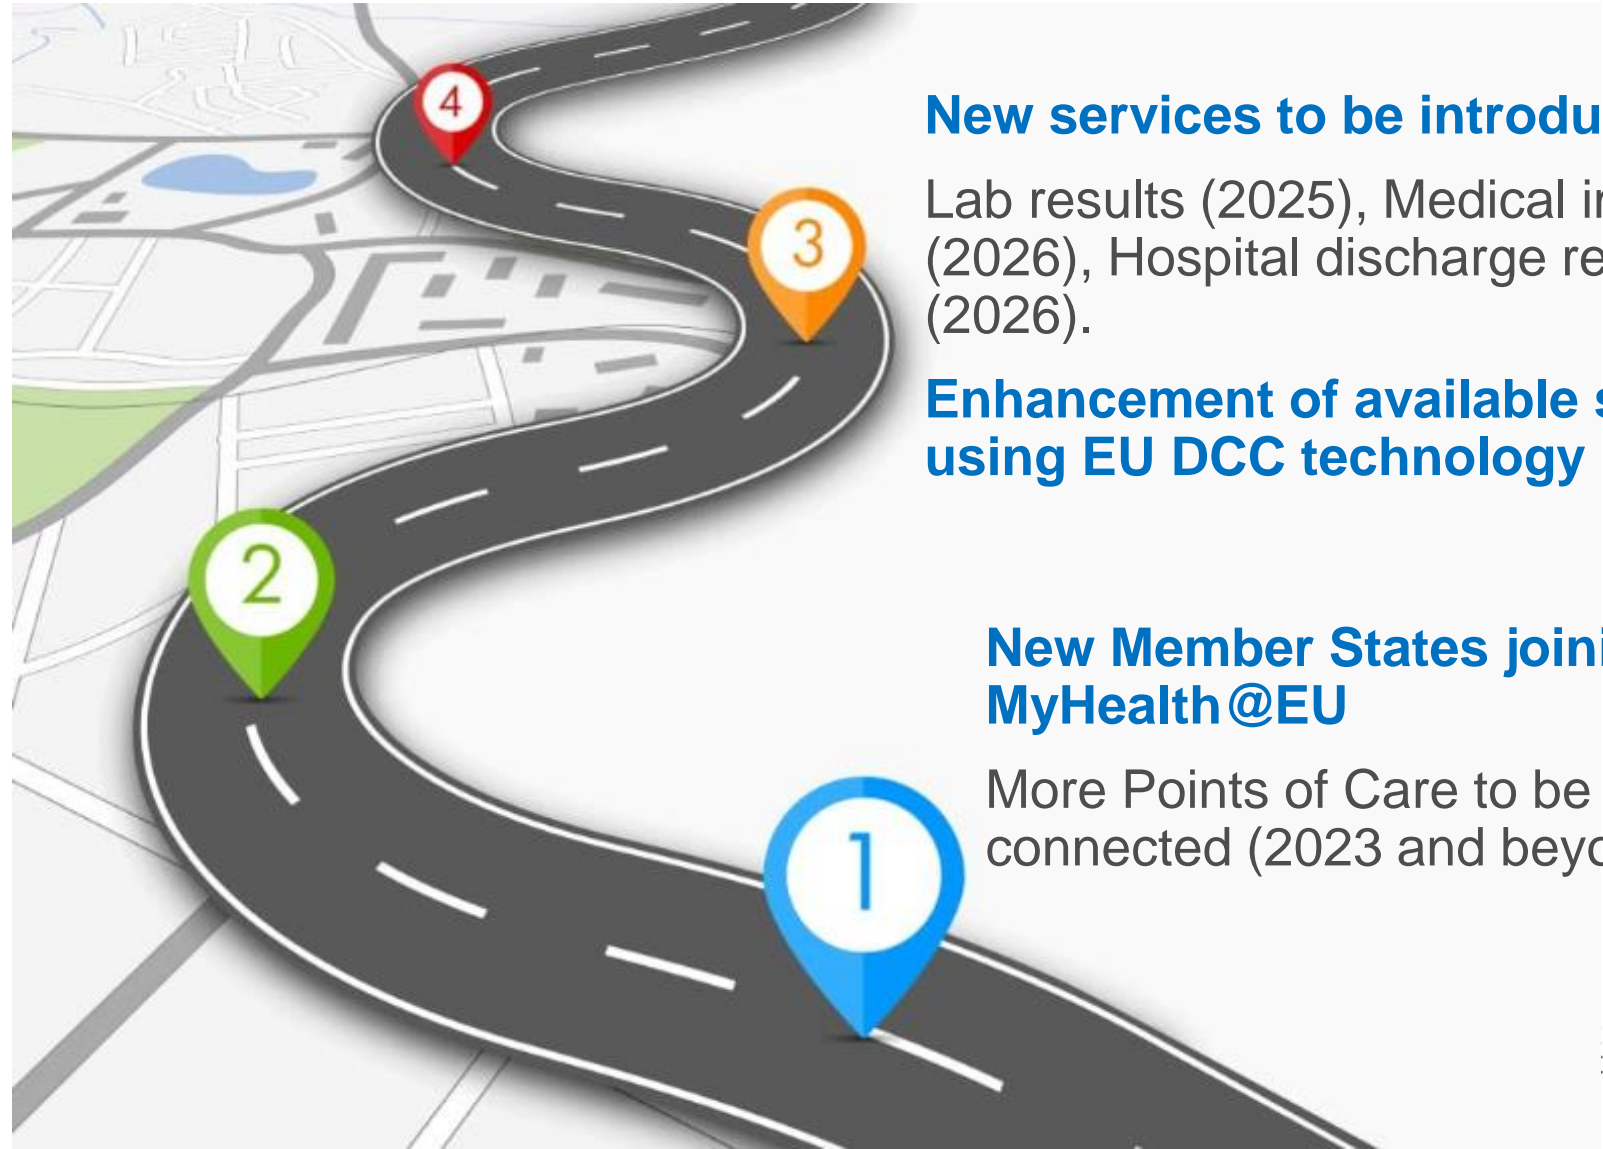

MyHealth@EU roadmap

Entry into force of EHDS regulation

Mandatory participation in MyHealth@EU for all Member States with transitional periods for the different services

Pilot on Patient Access

to enable citizens to access health data in MyHealth@EU (Jan 2023-Jun 2024).

New services to be introduced

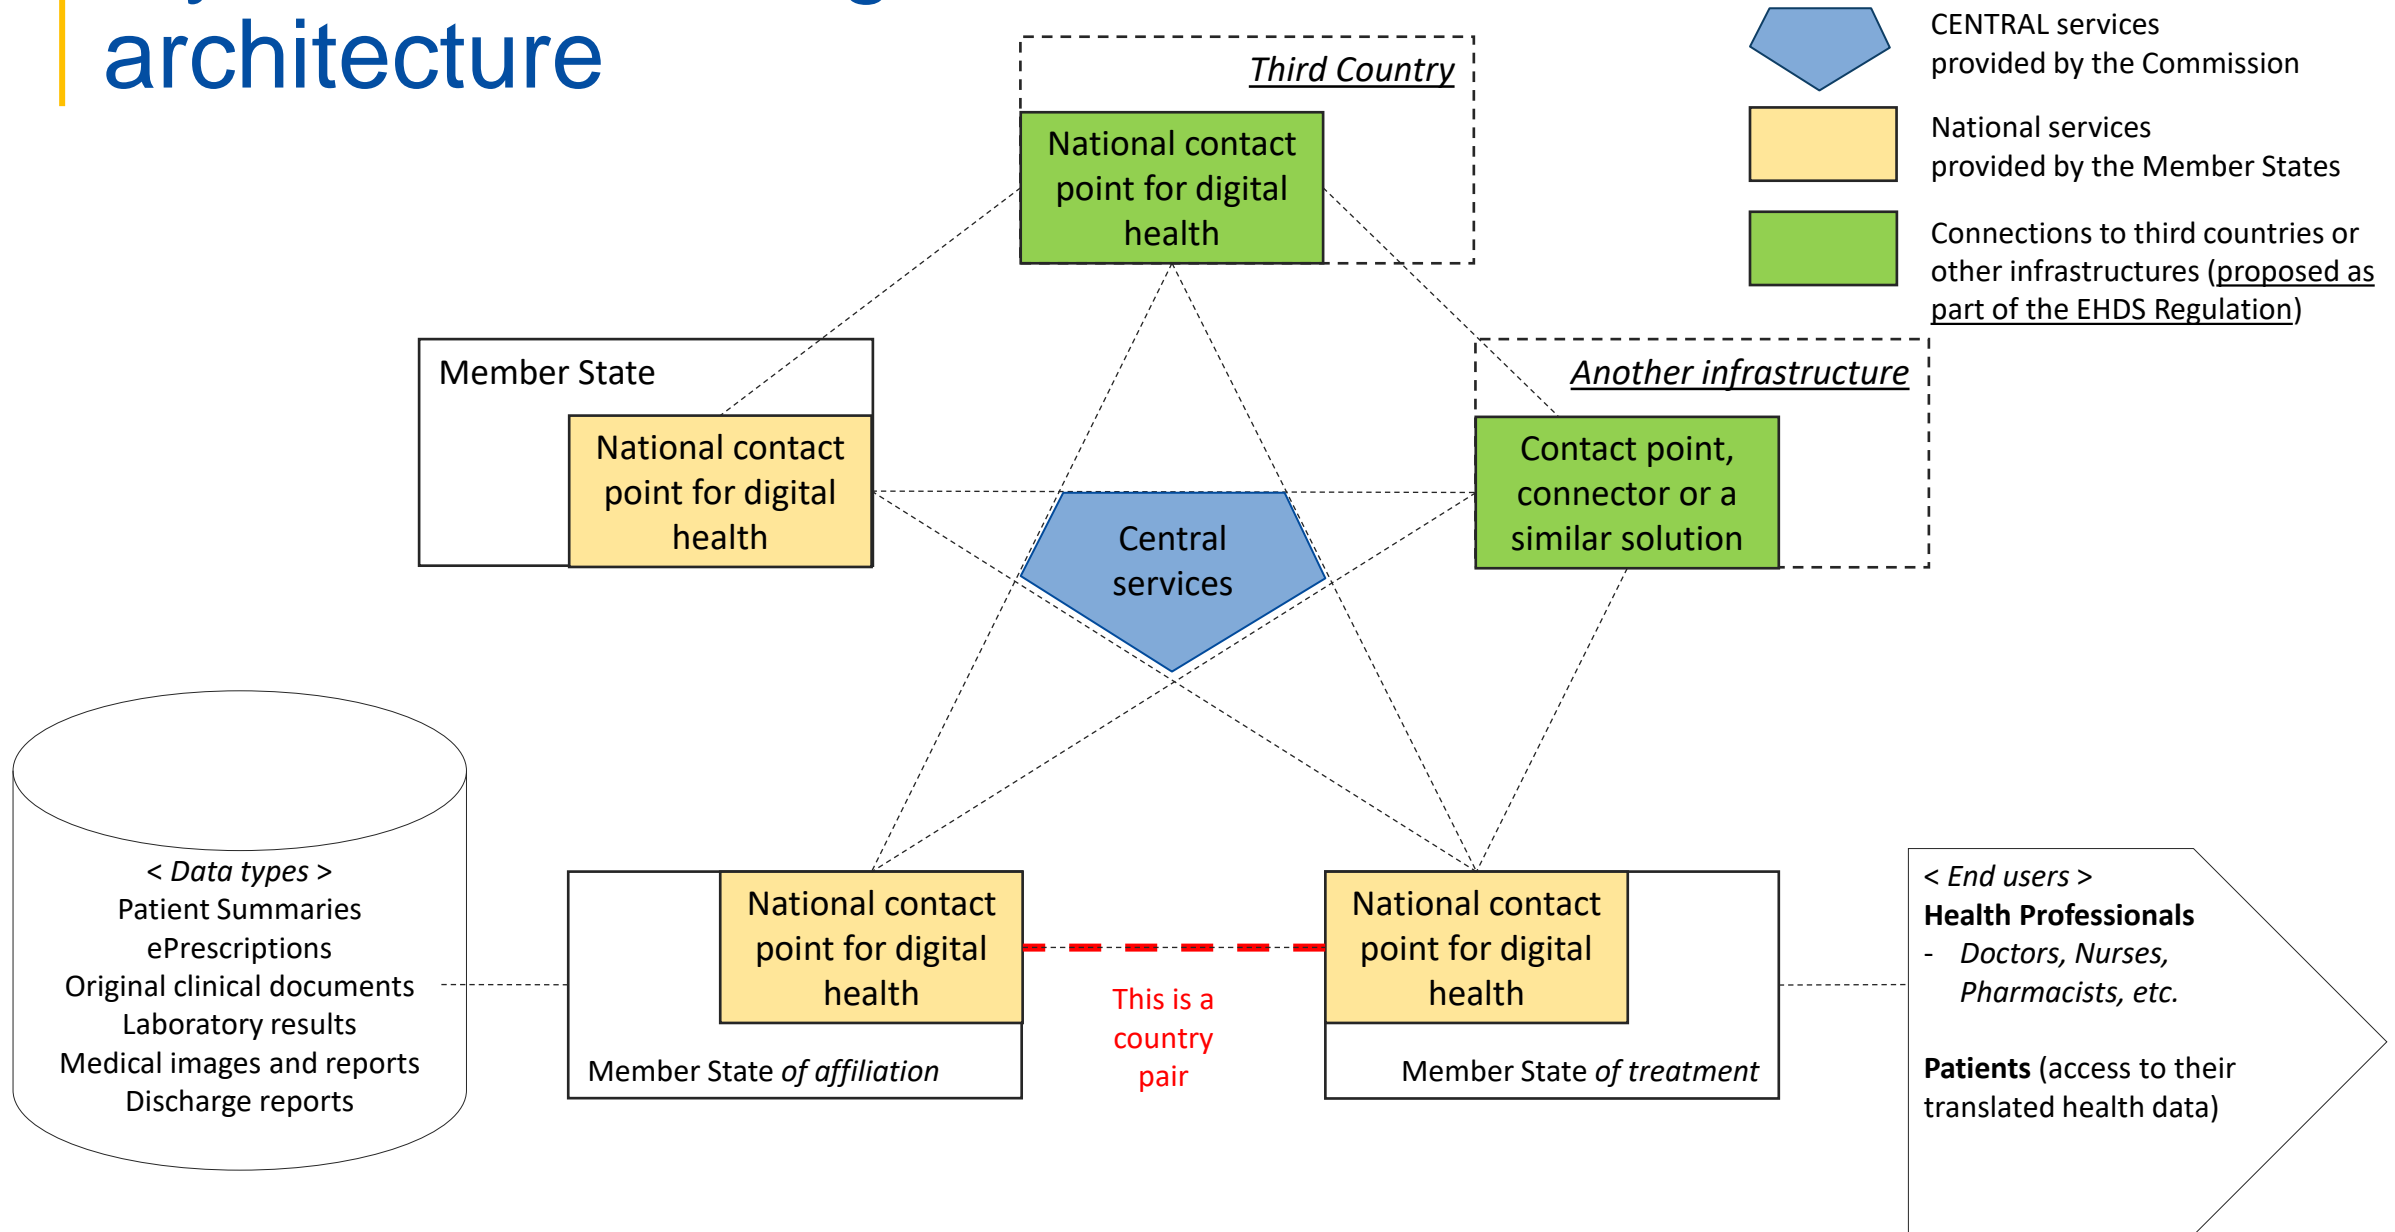

Lab results (2025), Medical images (2026), Hospital discharge reports (2026).

Enhancement of available services using EU DCC technology

New Member States joining MyHealth@EU

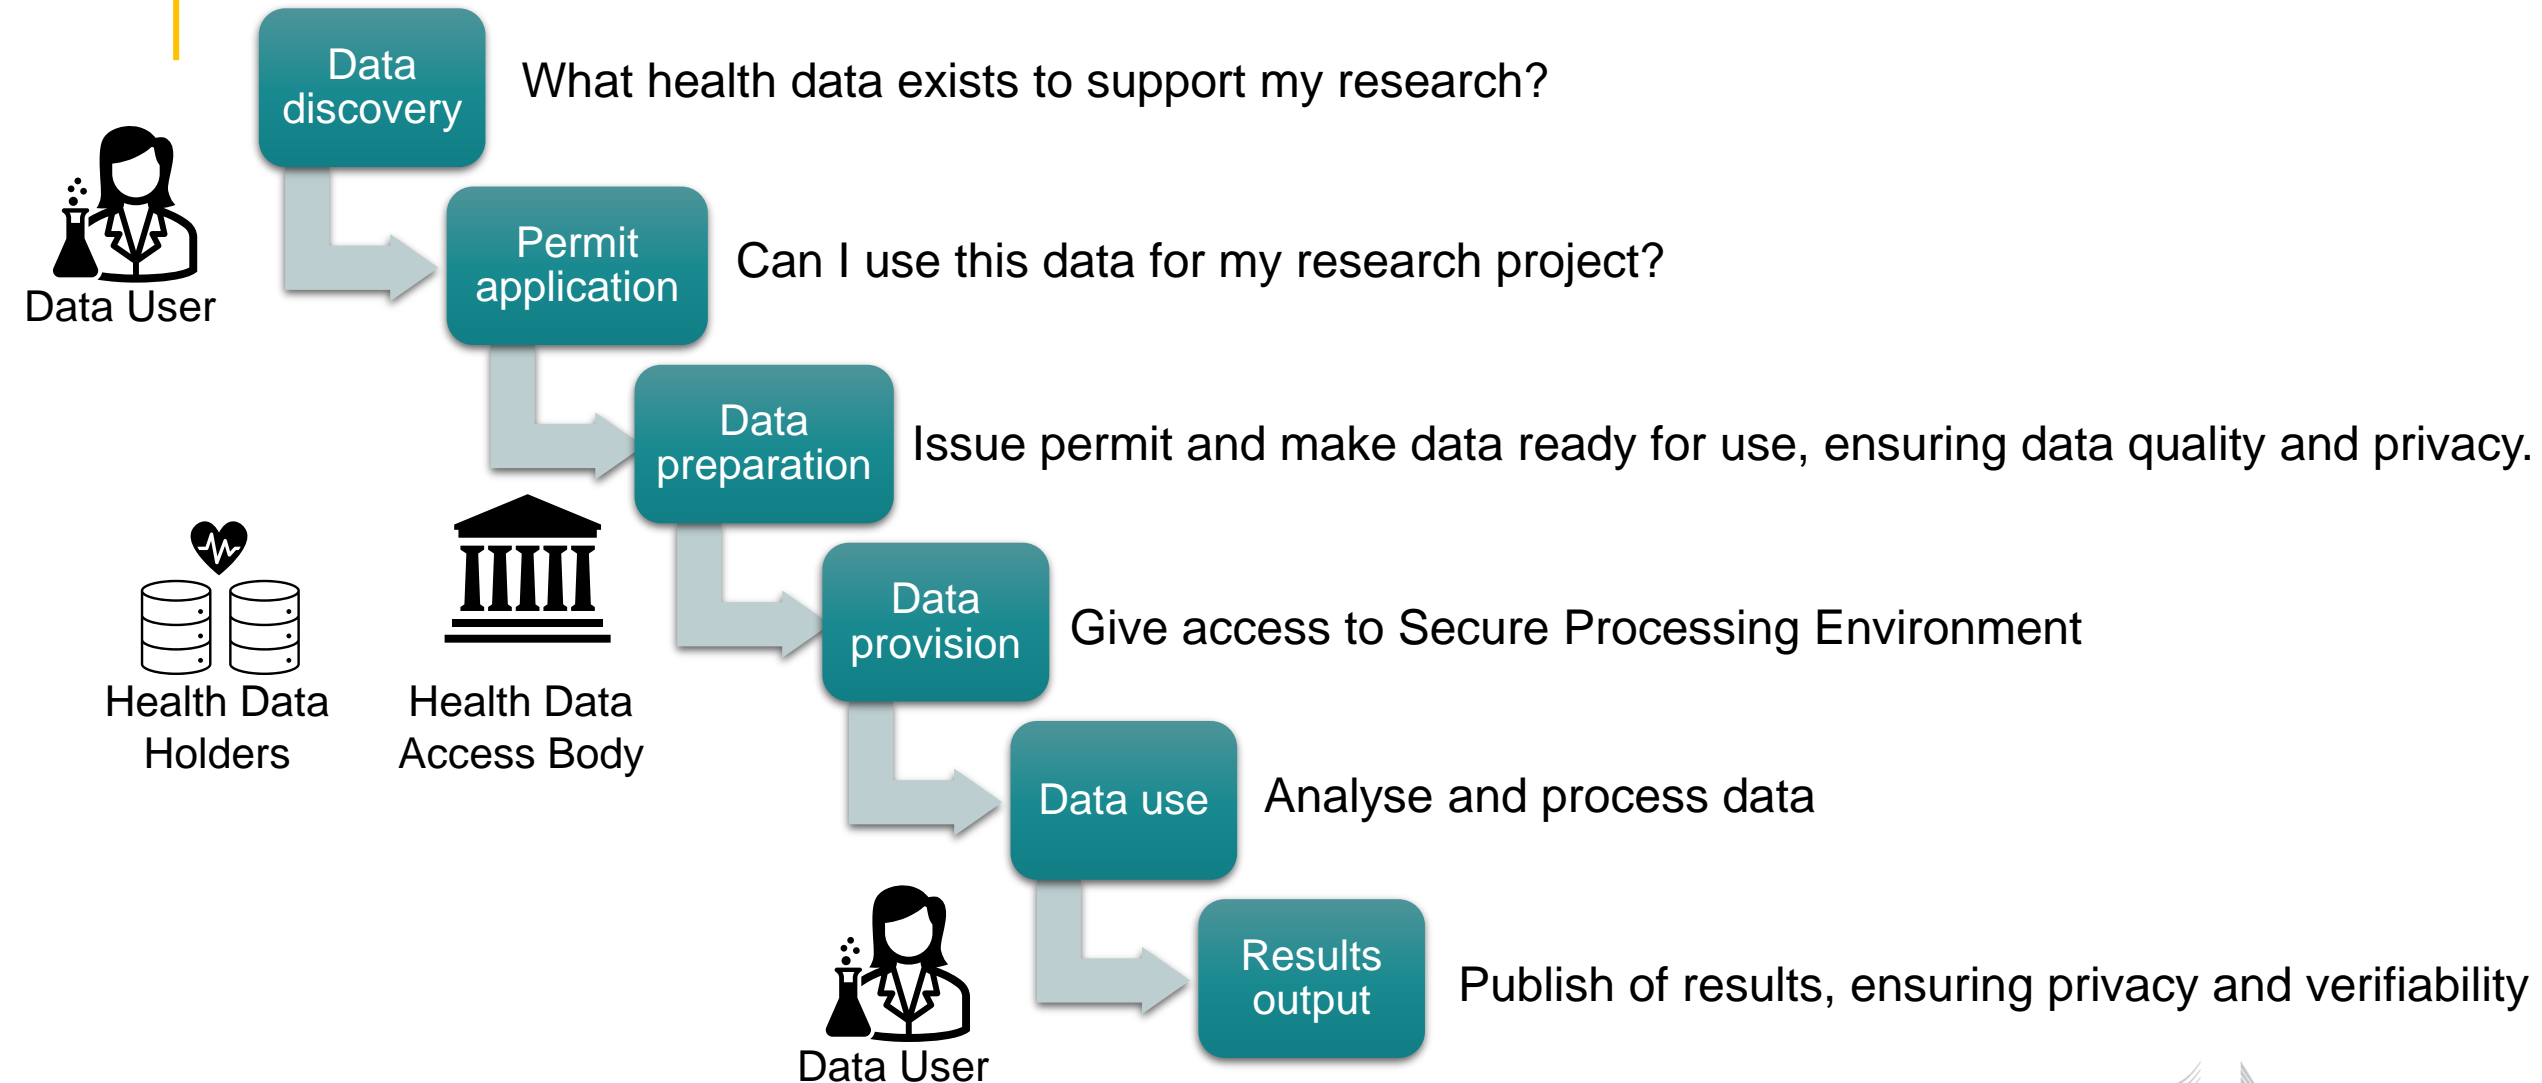

More Points of Care to be connected (2023 and beyond)

MyHealth@EU high-level architecture

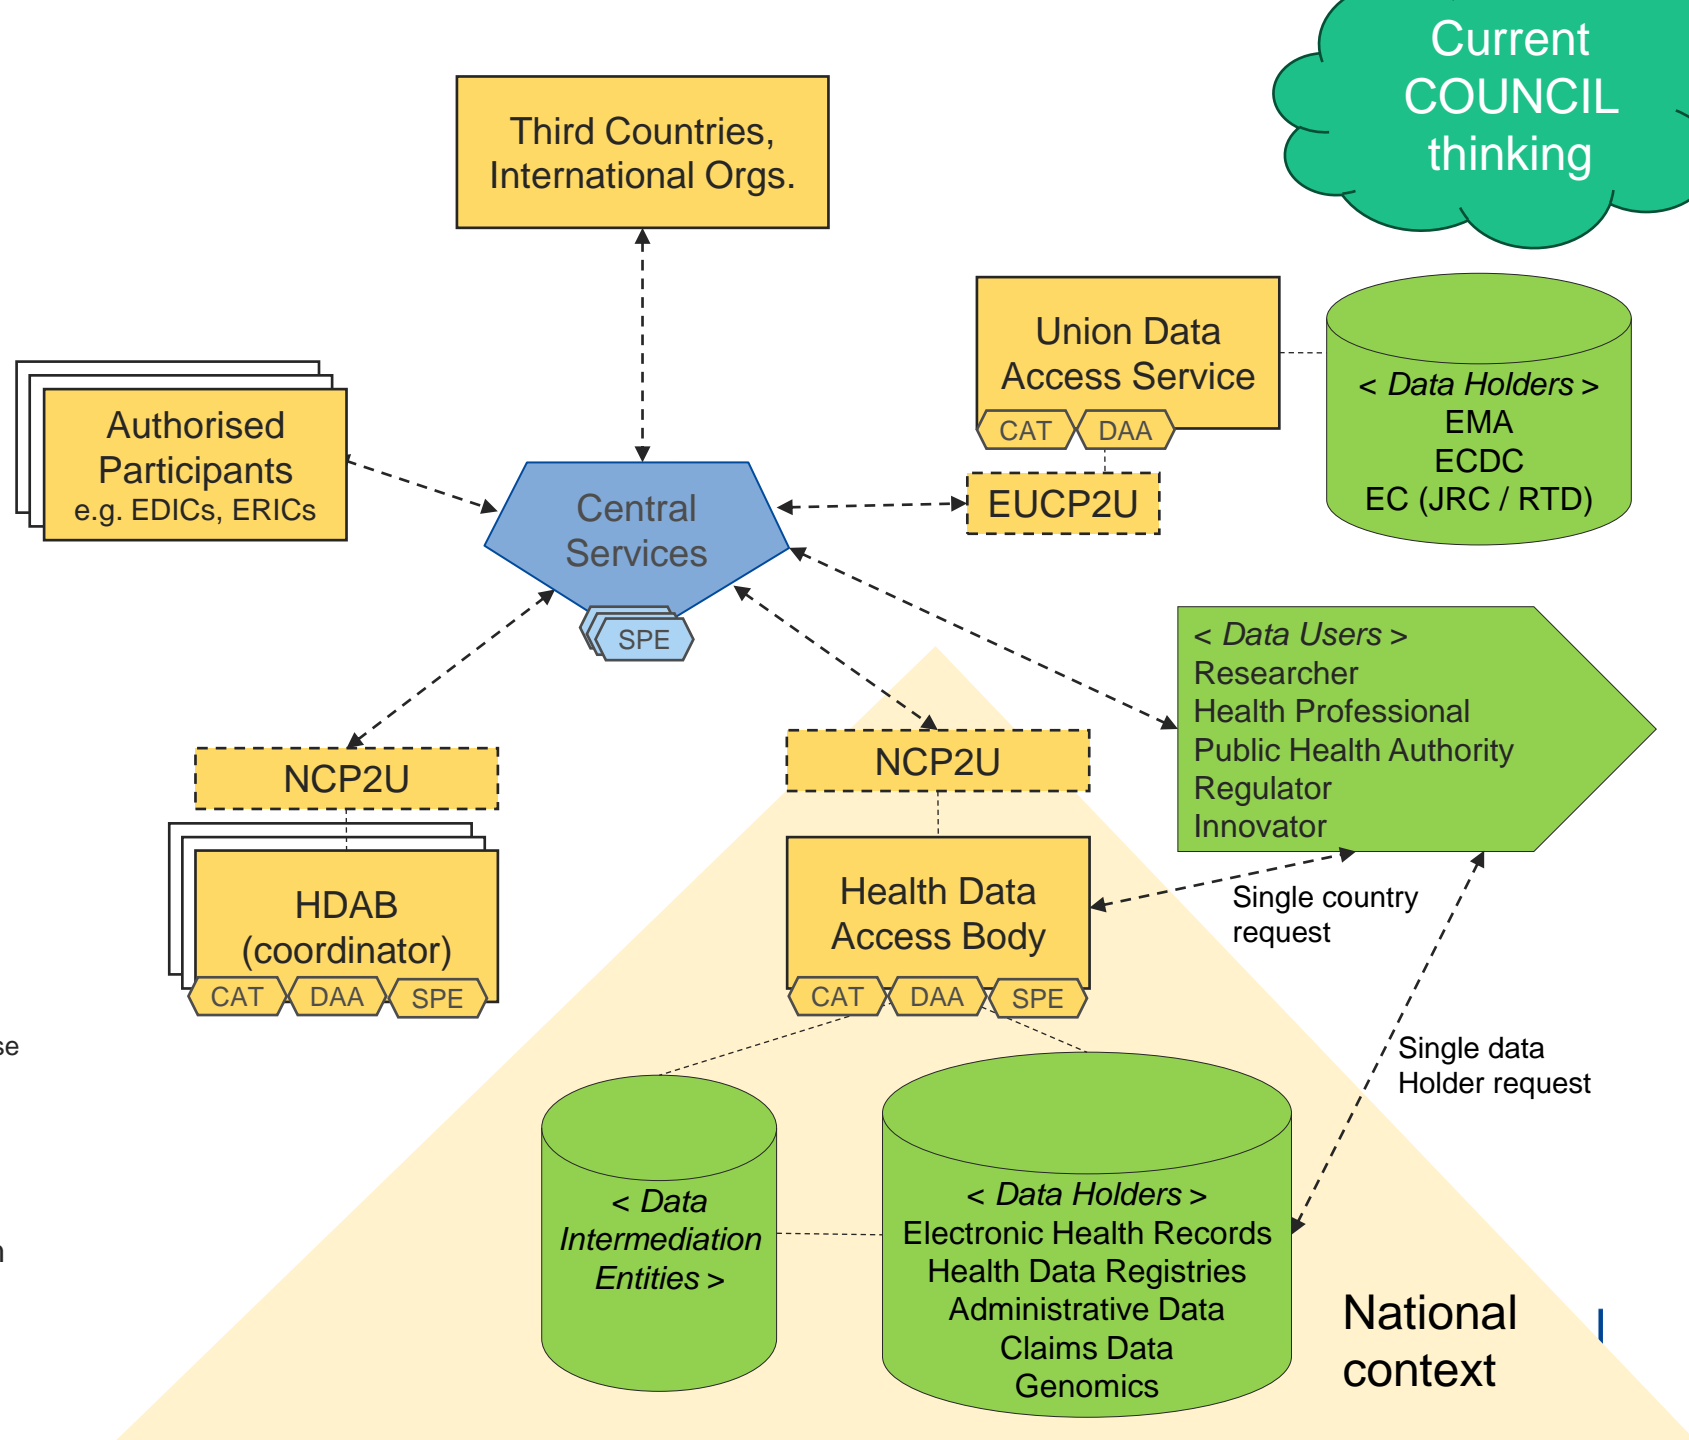

Secondary Use of Health Data

Data User journey

Cross-border secondary use infrastructure

HealthData@EU

 Central support services provided by EC

 NCP2U - National Contact Point for Secondary Use
EUCP2U - European Contact Point for Secondary Use

 Data access services

 CAT National dataset/metadata catalogue

 DAA Data Access Application Management system

 SPE Secure Processing Environments

 Local services provided by/to local partners

National context

EHDS2 – Overall timeline

d. What is the role of EU level legislation in the pathway to health and wellness apps reimbursement

Petra Wilson, Senior Advisor, European Health Policy and EU affairs, HIMSS

CONTENT

- **Current EU legislation**
- **Emerging EU legislation**
- **Where are Member States going?**

Current EU legislation I

Reimbursement of apps in the healthcare sector is not regulated at EU level

Why?

Public Health is a shared competences (Art 168 TFEU)

- ⑨ **Member States** define and deliver healthcare, including allocation of resources
- ⑨ **EU's** actions are complimentary, focusing on cross-border aspects and harnessing new technologies for the benefit of efficient health systems

LEGISLATION

Safety /
Consumer
protection

- Medical Device Regulation (MDR)
- Product Liability Directive

Data
protection

- GDPR

Bring to
market

- Regulation on HTA
- Transparency Directive of pricing and reimbursement of medicines

Data
security

- Network and Information Security Directive (NIS2)

Impact on Apps

- Decide if a Medical Device, comply with MDR
- Liability for harm
- Protect app user data
- If publicly reimbursed

EU level
legislation
does not
dictate
levels of
reimburse
ment

transparency *could*

apply

- Healthcare

Emerging EU legislation

LEGISLATION

- Creating Data Spaces
 - Data Governance Act
- Making non-personal data available, transferable
 - Data Act
- Making health data more useable, inc from wellness apps
 - EHDS Regulation
- Safeguarding data in cyberspace
 - Cybersecurity Act
 - Cyber Resilience Act
- Safeguarding EU values, principles in AI systems
 - AI Act

Impact on Apps

- Data interoperability and labelling (FAIR)
- Separation of personal and none personal data generated by apps
- Providers of app based services to ensure data security

EU level legislation does not dictate levels of reimbursement

Reimbursement models are defined by national law

Existing approaches selected markets – as reported by EFPIA*

Country	National value assessment framework	National reimbursement pathway	Available funding mechanisms
 Belgium	DTx clinical and/or socioeconomic value evaluated through Validation Pyramid	Apps in Level M3 of Validation Pyramid reimbursed by payers	Centralised funding for mHealth apps
 Germany	DiGA process: Standalone DTx evaluated by BfArM	DiGA process: All listed DiGA are reimbursed	GKV-SV centralised funding for DiGA
 France ¹		Apps in Level M3 of Validation Pyramid reimbursed by payers	Centralised funding for mHealth apps
 Italy			

Reimbursement models are defined by national law

Existing approaches selected markets – as reported by EFPIA*

Country	National value assessment framework	National reimbursement pathway	Available funding mechanisms
 Netherlands			Covered by individual health insurers
 Spain			Evidence of limited regional reimbursement
 Sweden			
 UK	NICE has developed evidence standards framework for digital health technologies		Can be funded locally by Integrated Care Systems

What are the Common Challenges?

COMMON CHALLENGES AT NATIONAL LEVEL

- Lack of clear conceptualization of digital health
- Limited applicability of HTA models
- Lack of value-based pricing and reimbursement mechanisms
- Slow development of reimbursement models and pathways in healthcare funding

COMMON CHALLENGES AT EU LEVEL

- Limited EU level regulation of Apps and Dtx – only those in scope of MDR, lack of MDR harmonisation on dossier interpretation
- No harmonised EU level evidence requirements for HTA, esp. on use of RWE – potential expansion on HTA Regulation to apps and DTx

Humber and North Yorkshire
Health and Care Partnership

Empowering Health Care

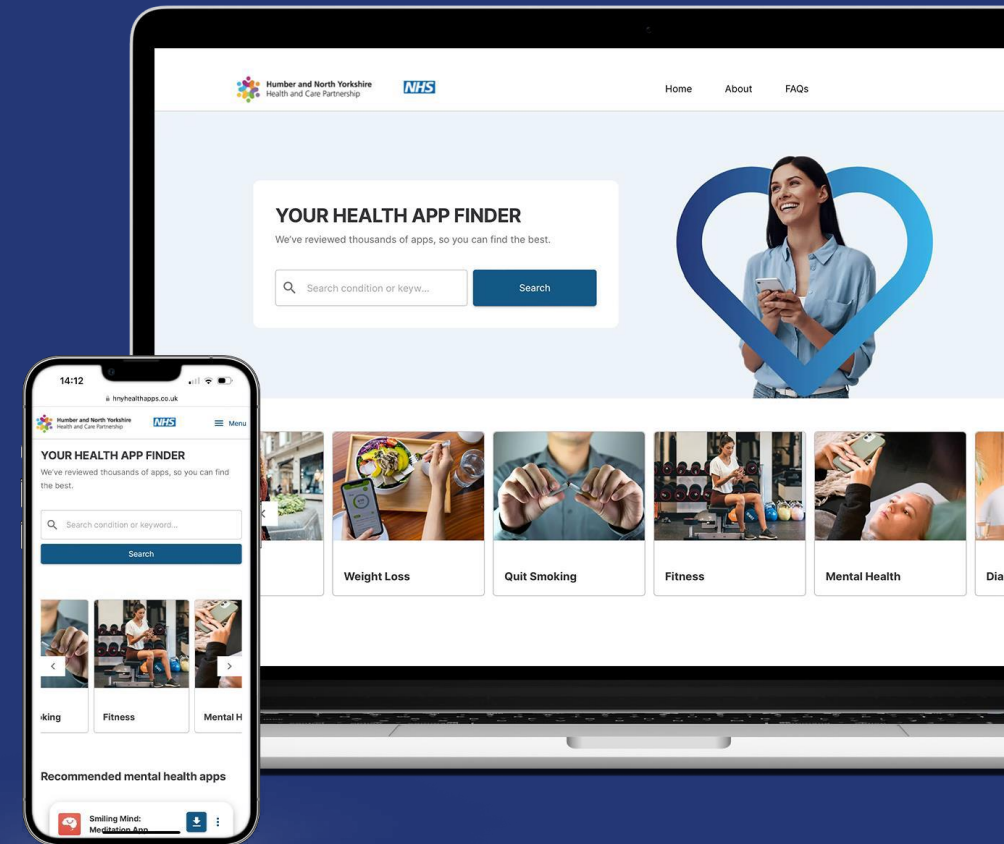

*Unlocking the power of digital health Apps in
collaboration with NHS Humber & North Yorkshire ICB*

Presented by: Carrie Cranston – Digital
Programme Support Manager

Introduction

- NHS Humber and North Yorkshire Integrated Care Board looks after the NHS spending and performance across a region home to 1.7million people
- A key priority within the Humber & North Yorkshire Health & Care Partnership Digital Strategy is to be able to empower citizens to better manage their own health and wellbeing, via the use of digital solutions.
- This is driven by citizen need across all health and care services and ultimately, supports with a reduction in capacity and demand for other services which is at an all-time high.

Partnership and Collaboration

Humber and North Yorkshire
Health and Care Partnership

Our partnership with ORCHA has allowed us to identify pain points across the ICB where digital health solutions can allow for support and self-management of identified condition areas.

Utilising digital health solutions and the assurance provided through the ORCHA platforms has enabled us to design safe tailored health campaigns for specific target populations.

ORCHA

Supporting demands on services

Humber and North Yorkshire
Health and Care Partnership

One of the key needs identified, was to support our acute trusts across Humber and North Yorkshire around their Elective Care Recovery Programme.

Cardiology

MSK

Ophthalmology

Dermatology

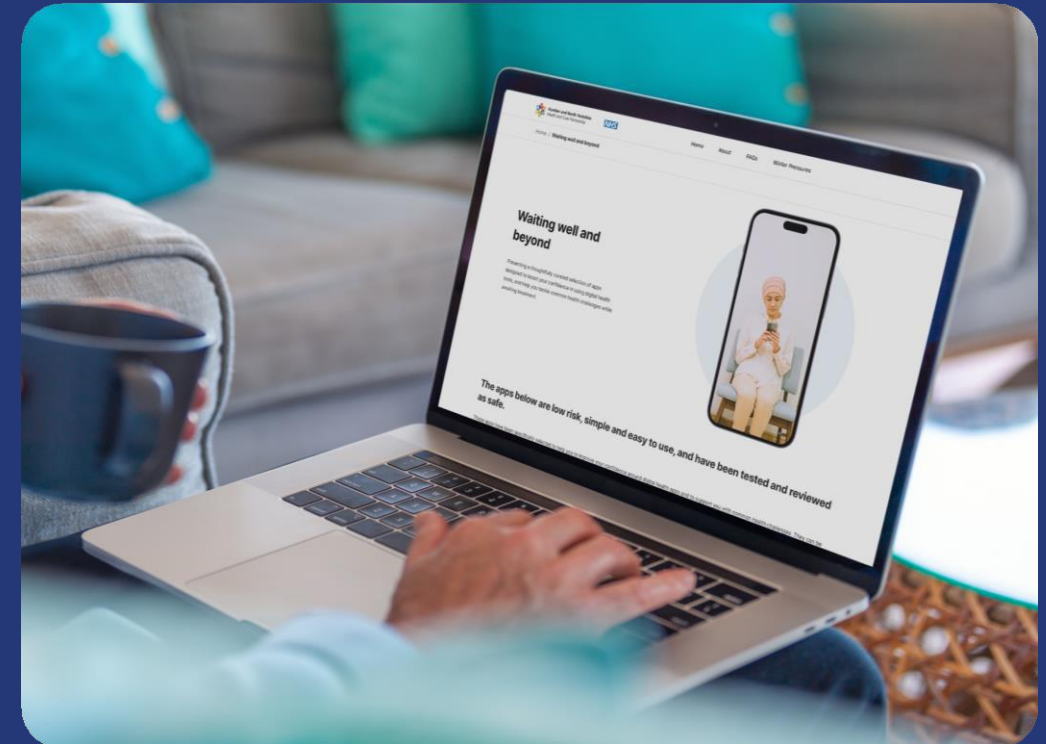

Waiting well and beyond

Humber and North Yorkshire
Health and Care Partnership

- A carefully selected number of apps were chosen with guidance from ORCHA's Clinical team.
- All apps were then verified by ORCHA's assessment team to make sure they met the ORCHA Baseline Review adding an additional layer of assurance.
- ORCHA's Product and Development team supported building the landing page to ensure it was a space that was easy to navigate and engaging to the population.
- ORCHA's team collated digital collateral including Posters and QR codes so that we could widely promote the campaign.

Activation and Deployment

Humber and North Yorkshire
Health and Care Partnership

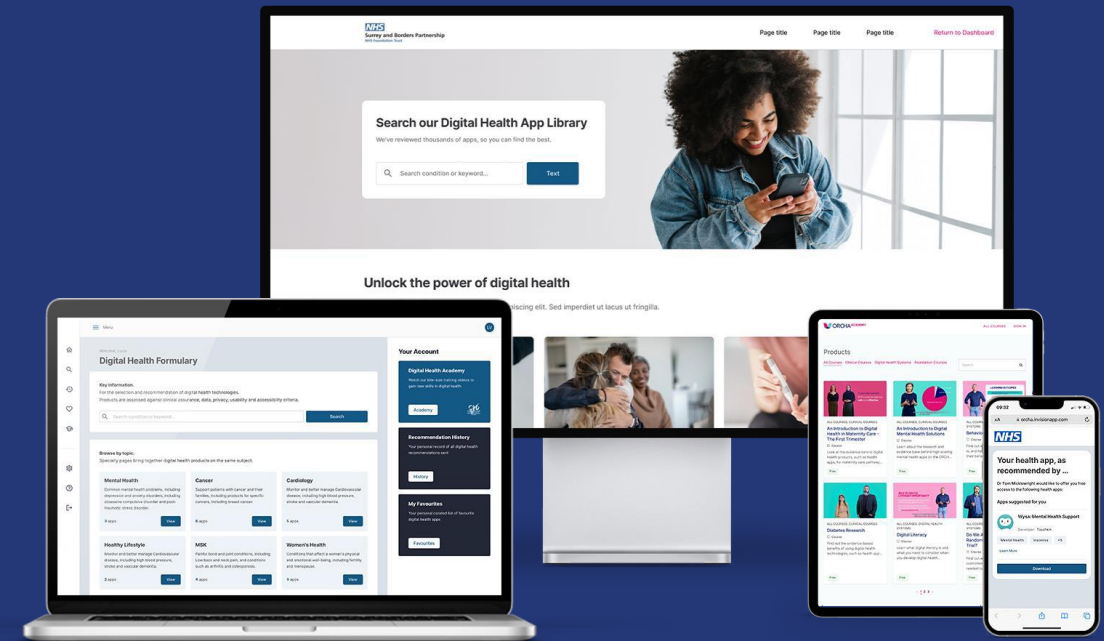

So, what have we been doing locally to deploy and encourage the use of the HNY Elective Care Campaign?

Direct to population via the patient facing library

- Social Media engagement
- GP Text Messages
- Digital collateral in GP Surgeries and hospital waiting areas
- Promoted on ICB intranet sites and newsletters
- Included on outpatient letters to patients

Professionally supported through the digital formulary

- Digital collateral to be shared with patients
- QR Codes given to professionals for patients to scan
- Professional training to support direct app recommendations to patients

Outcomes and Results

7,648 Page Visits

27% Downloads

During August and September, the programme saw 7,648 people visit the page, and approximately 27% of these people download a health app as a result

(1,021 on page downloads and an equal number of off-site downloads).

£93 Saving Per App

£189,906 total saving

Based on NICE evidence, each download helps save the NHS £93 in costs. And so over eight weeks, this campaign not only helped provide support to people when they needed it, improving their health, but also saved the NHS £189,906.

Over £1 million
potential saving
per year

If this continues over one year, the saving could be over one million pounds (£1,006,706).

Future Outlook

Humber and North Yorkshire
Health and Care Partnership

- Continuation of Elective Care Support
- Humber and North Yorkshire Swap and Stop Campaign
- Diabetes and Long-Term Condition Support
- Virtual Wards
- Mental Health Support

b. Croatia

Why and **How** TO DECIDE to start reimbursing health apps

Siniša Varga, former Minister of Health Croatia

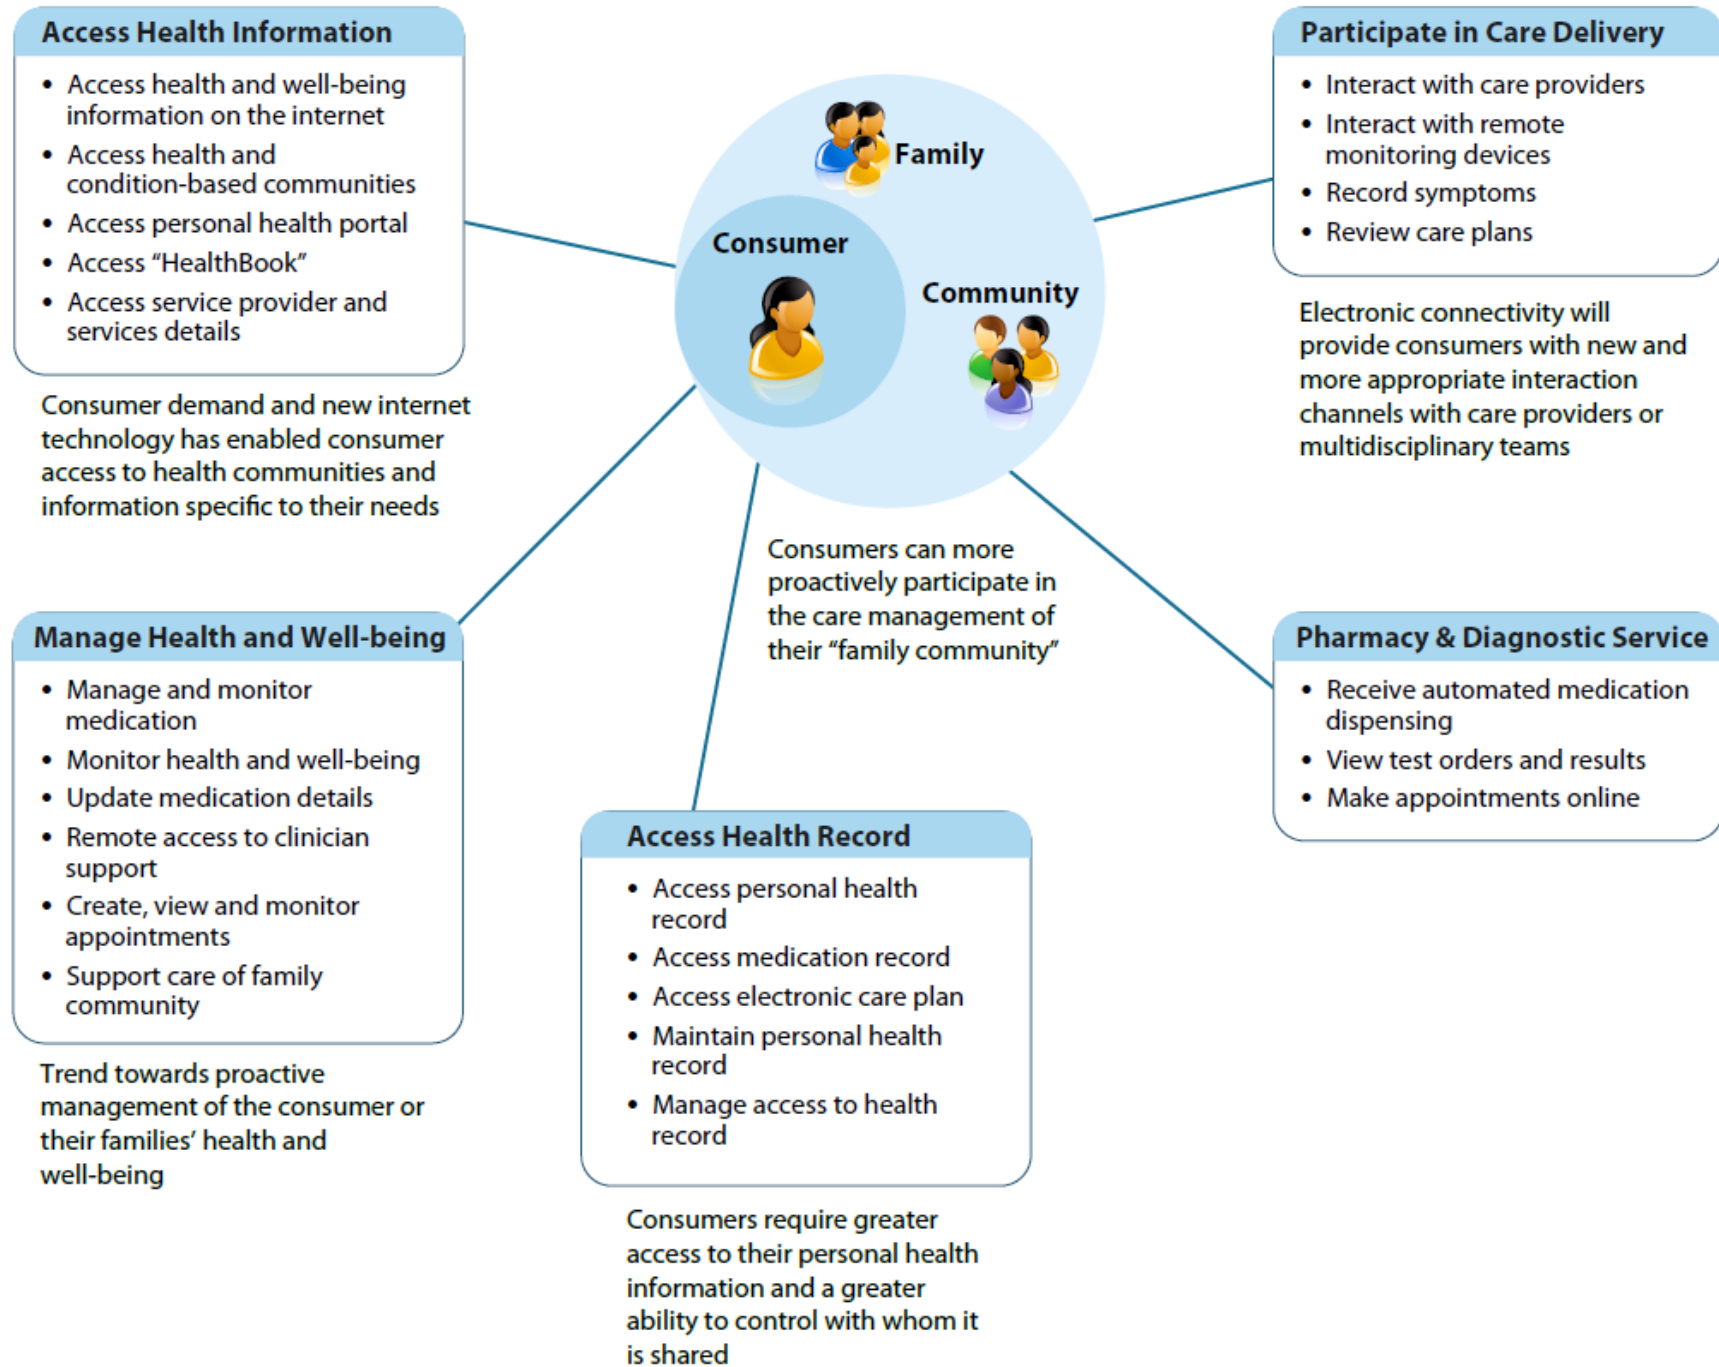

3rd roundtable on the reimbursement of health apps

February, 2024

WHY

– for patients

- Access Health Information
- Manage Health and Well-being
- Access Health Record
- Participate in Care Delivery
- Pharmacy & Diagnostic Service

WHY – for other stakeholders (HP and HCP)

- Enables **communication** and data exchange between **patients** and **providers**
- **Supports treatment** (health apps as part of the integrative approach)
- Allows **remote consultations** with patients, for second opinions, and with professional networks
- Improves **integration of care** and multidisciplinary healthcare providing
- Supports healthcare professionals with **knowledge base** within the apps, especially if integrated in guidelines
- Improves **digital health literacy**
- Improves **shared decision making** with patient
- Increases **adherence to therapy**

WHY – for other stakeholders (government)

- Delivers more **reliable, responsive and timely reporting** on public health; as health becomes increasingly central to economy, security, foreign affairs and international relationships.
- Creates **enabling environments** rather than technology limitations.
- Offers **new roles** for stakeholders, health professionals, authorities, citizens and others.
- Improves **business processes**
- Compensates for **lack of doctors**
- Compensates **unlimited demand** with limited resources (time/people/money)

WHY – for other stakeholders (public health)

- Monitors **quality and safety**; improves care processes and reduces the possibility of medical errors
- Assists **mobility of citizens and their medical records** – providing patient information when and where needed
- Opens new opportunities in **basic and applied research**; from health knowledge to policy and action (providing evidence for public health interventions)
- Identifies **disease and risk factor trends**; analyses demographic, social and health data; models diseases in populations

HOW – leadership, governance and multi-sector engagement

- Direct and coordinated **implementation at the national level**; ensure **alignment** with health goals and political support; promote awareness and engage stakeholders.
- Use mechanisms, expertise, coordination and partnerships to develop or adopt all components (e.g. **certification scheme, standards**).
- Clearly **define roles and responsibilities** (certification body? HTA?)
- Support and empower required **change, implementation** of recommendations and monitoring results for delivery of expected benefits.
- Enable **transparency**, Measure **results**, Manage **information** flow
- Take special care of the **vulnerable group** (education, equipment)
- Engage **professional associations** to implement health apps in **guidelines**

HOW – strategy and investment

- Ensure a **responsive strategy** and plan for the national implementation.
- **Lead planning**, with involvement of major stakeholders and sectors.
- **Align financing** with priorities, government, patient and private sector funding identified for medium term.
- Plan **creative payment schemes** (incentives for the stakeholders involved):
 - doctors who are **prescribing** health apps,
 - patients who are regularly **using** health apps,
 - healthcare providers who are **promoting** health apps,
 - manufacturers who are providing **innovations** (carefully assess the value compared to price)

HOW – legislation, policy and compliance

- Adopt **national policies** and **legislation** in priority areas.
- Ensure **safety and proper use**
- Review **sectoral policies** for alignment and comprehensiveness.
- Establish **regular policy reviews**.
- Create a **legal and enforcement environment** to establish trust and protection for consumers and industry.
- Align with **EU (best) practice**
- **Regulate use** and sharing of collected data for research and the public interest

HOW – standards and infrastructure

- Adopt **national policies** and **legislation** in priority areas.
- Review **sectoral policies** for alignment and comprehensiveness.
- Establish regular **policy reviews**.
- Create a **legal and enforcement environment** to establish trust and protection for consumers and industry.
- Set clear **interoperability requirements**
- Integrate with **EHR**
- Take care of the **network coverage** in rural parts (60 inhabited islands)

CONCLUSIONS

- **WHY** – clear necessity for patients and other stakeholders
- **HOW** - national level coordinated implementation aligned with health goals and political support
- **REIMBURSEMENT** of health apps will happen, this is the only way forward for any country.
- It is important to choose a good path adapted for each countries situation/possibilities where **CERTIFICATION** is at utmost importance to ensure primarily safety and efficacy for the patients.
- The value is clear, however good **GOVERNANCE** is a key success factor.

Thank you

c. Catalonia

S/Catalonia: Assessing the Landscape of Health App Reimbursement and Providing Recommendations

13th of February 2024

Label2Enable 3rd roundtable discussion

S/ Agenda

1. About Catalonia
2. Background
3. Current status
4. Reflections and recommendations

S/ About Catalonia – Who are we?

8,001,703

Population in Catalonia on January 1, 2024.

Universal coverage

The publicly health care system of Catalonia was founded in 1990 under the principle of universality; so all individuals and communities are able to receive the health services.

12,500 M€

Catalan Health Service budget for 2020. The system is funded from general taxation and government funds and contributions.

> 160

Health care entities to provide health care services.

HIT fragmentation

Huge fragmentation of HIT across the Catalan Health System:

- ✓ 1 EMR for primary care.
- ✓ > 29 EMR products in the Intermediate care hospitals.
- ✓ At least 10 different systems for social care records.

699

Facilities that range from primary health care centres to hospitals and intermediate care centres.

- 369 Primary Care Centers
- 69 Hospitals
- 96 Intermediate Care Centers (long-term)
- 165 Mental Health Centers

S/ About Catalonia - Organisation

Regional Ministry of Health → Sets policy

Public insurance → Health planning and allocation of resources

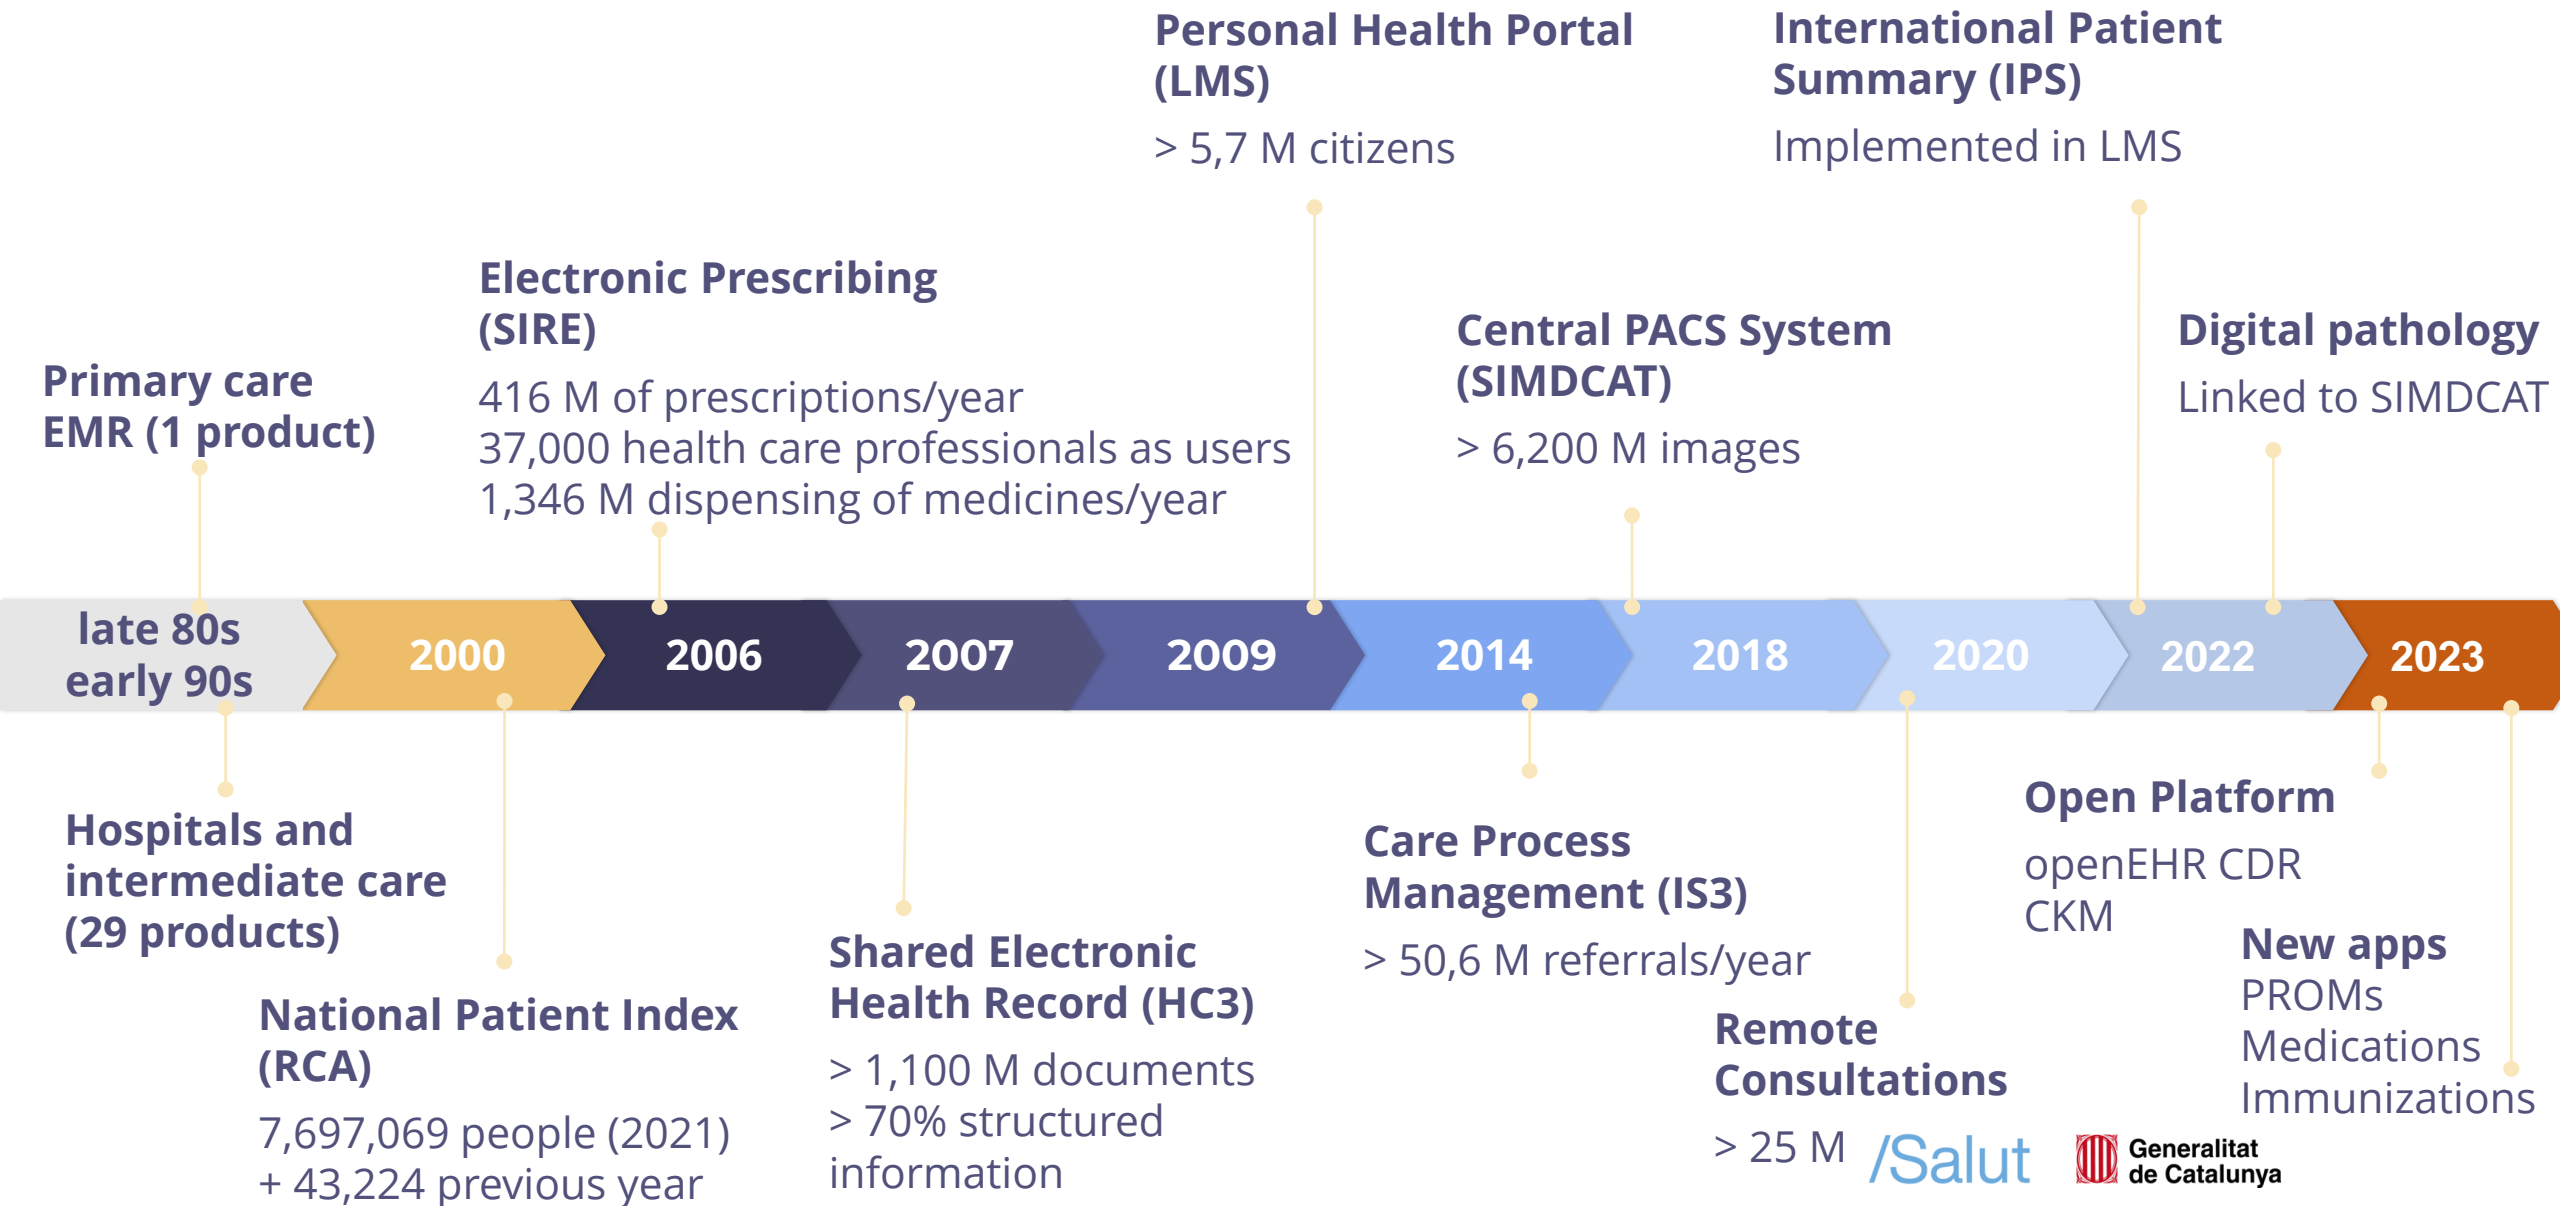

**Agència de Qualitat
i Avaluació Sanitàries de Catalunya**

**Health Technology Assessment Agency →
Quality and evaluation of new therapeutics**

**Digital transformation → Promote innovation
through the digital transformation**

S/ Background – The Digital Health Platform

S/ Background – mHealth (2015)

Catalan Ecosystem

mHealth

Promote mHealth solutions

Observatory

Assessment Process

Interoperability framework

New guidelines and requirements

Citizens

S/ Background – how to set priorities?

Generalitat de Catalunya
Departament de Salut

CatSalut /Salut

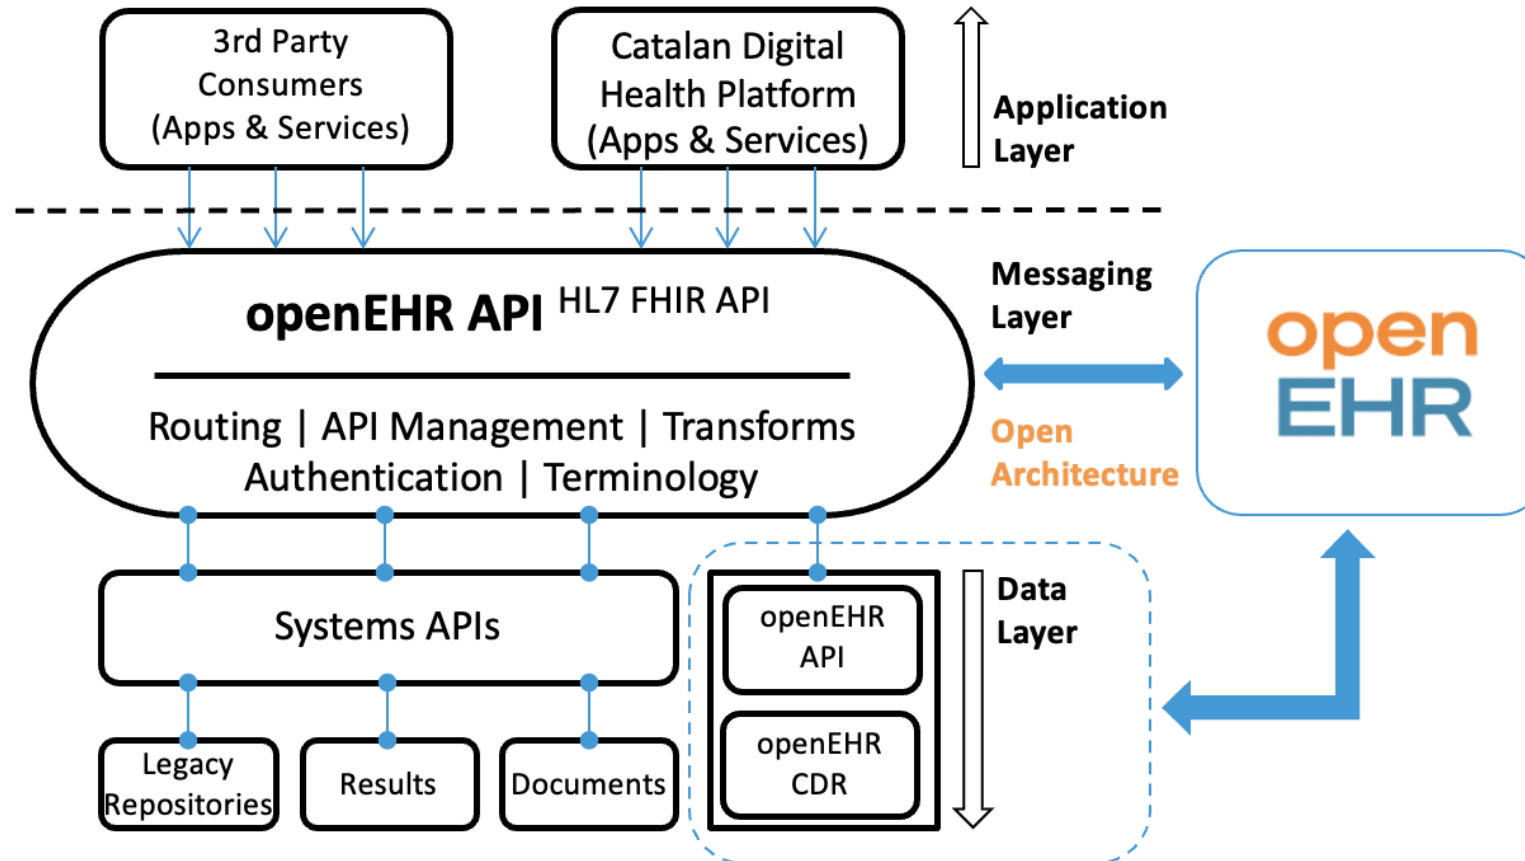

S/ Current status – assessment of mHealth

- 1. Comparison of the FTSS and ISO Evaluation Framework** – Production of an adaptation guideline for countries having their own assessment framework.
- 2. Dual Assessment** – Evaluation of 2 apps following the FTSS and ISO Evaluation Frameworks to compare results.
- 3. Publication of the Requirements Guide for Digital Assets to all Providers** – Guidelines for providers in Catalonia, including security, usability, and accessibility requirements, also adapted to ISO.

S/ Current status - reimbursement

1. Catalonia is not directly reimbursing the deployment of mHealth solutions.
2. Service provider organisations have found alternative ways to introduce such solutions in routine care under the umbrella of the current reimbursement system.

S/ Current status - interoperability

The open platform approach for Catalonia (source: adapted from the Apperta Foundation – United Kingdom)

S/ Reflections and recommendations

1. **Strategy towards the adoption of mHealth solutions** → FTSS in charge of promotion, observatory and assessment.
2. **Generating evidence** → The assessment process produces results that generate transparency and trust.
3. **Scaling up beyond pilots** → Providing the capabilities for mHealth solutions to interoperate with the Catalan Digital Health Platform.
4. **Participation in international activities** → FTSS participates in international projects to bring in new evidence.
5. **Import the learning from other therapeutic areas** → Pharmacotherapeutics have clearly established pathways towards moving their products into routine care. Let's copy!

Thank you!

 - Labelling in Africa (next work)

XXI Century Health & Main Advanced Digital Health Challenges

+ age
+ tech
+ Knowledge

Aims for Health Care Delivery System

- Equitable
- Safe
- Effective
- Patient-Centered
- Timely
- Efficient

Data - Open and FAIR principles, (the NEW GOLD)
Information – Sharing is key (content interoperability)
Knowledge – is rare (involves Hybrid-I and Advanced-I)
Meta-knowledge – network and strategy (know who knows what and how it knows)

- **Digital Inclusion** - Capacity to ensure advanced tech is equitably accessible to organizations/citizens
- **Minimally disruptive Tele/meta health services** – Tele/metahealth services that offer high Quality-of-Care
- **Trustworthy Digital Clinical Services** – Including mHealth APPs; AI-based Solutions; Digital Therapeutics
- **Health data economy & health innovation** – Health data spaces for data exploration and care integration/innovation
- **Digital sovereignty & sustainability** – Creation of digitally advanced infrastructures and processes that cybersecurity, governmental sovereignty and cost-effective architectures

Digital Health Systems

- **Vision...**
- **Preventive, paperless, empowering, personalised, and accountable.** Digital healthcare strengths lay not in technology but rather that digital technology will be present in processes, professionals and people, in ways such that **everyone can be a healthcare creator.**
- He/she can be a prevention specialist; care for him/herself and family with the best scientific support; access digital therapeutics by default. Moving to any form of needed physical care, drug therapy, surgery, hospital admission, or ventilation support, etc, as last resource

The image shows the exterior of a modern building with a stone facade and large glass windows. The building is identified as SPMS (Serviços Partilhados do Ministério da Saúde). Large blue text overlays are placed over the image. In the foreground, there are large, colorful 3D letters spelling 'SPMS'. People are walking on the sidewalk in front of the building. A sign on the building reads 'A SOLUÇÃO ESTÁ NA PARTILHA!'.

9 draft recommendations – HM Comments

1. **Govern** – Establish governance: who within the health authority is responsible for exploring and decision-making on assessment and reimbursement of health apps?
2. **Value** - Acknowledge **apps can do things that drugs can't and vice versa**. Both in their own way potentially add to health, wellbeing and can affect citizen, patient, carer and health system burden.
3. **Focus** - Determine which types of apps may deliver this value for which health issues and if applicable which types of patients. **Consider these apps for payment / reimbursement**.
4. **Create** - Create the habitat in which apps can deliver value. Integrate the quality assessed health apps of choice in care pathways to optimize value and to ensure potential for substitution / cost reduction is achieved.
5. **Fund** – Allocate related funds, consider innovative payment models, and explore need further policies.
6. **Assess** - Decide how to quality assess health apps or outsource such activities. **Consider using a trusted EU framework with your own additional national requirements if applicable**. Make the assessment results easily available, also to patients (e.g. label in frequently used / trusted sources).
7. **Enable** - Educate health care professionals (medical school, post graduate, MOOCs, also by professional societies and manufacturers,
8. **Support** - Explore a support role for patients of **/ similar to pharmacists for drugs**, alongside efforts from manufacturers to create easy to use apps and of insurers and hcps to require and reward such ease of use. Involve professional societies to provide guidance for health professionals
9. **Measure** –Measure value transparently. Publish reports and explore what else needs to be arranged to capture the attainable value of health apps.
10. **ADD ENABLE FOR TRANSFORMATION OF HEALTH SYSTEMS**

Label FOR WHAT type of ENABLEMENT ?

The need for a Healthcare Transformation Model

Adapted from Kotter "Leading change" 8 steps

Label FOR WHAT type of ENABLEMENT ?

The need for a Healthcare Transformation Model

Innovation in Quality-of-Care

	Uses establish technology and known (social) methodologies	Explores new Technology or new (social) methodology
New/(significant changes to the) Business model	(Potentially Disruptive: a new way of providing care (disruptive care process) or even a new healthcare business model but not exploring new technological basis	Architectural: Technological/methodological base changes AND healthcare businesses models/care process (potential) disruption
No changes to the Business model	Routine/Incremental: slowly builds on existing technological/process competences incrementally using established technology and known methods of working	Radical: There is a visible effort to create new technology or methodology to provide care differently with higher levels of quality

(WHO Europe QoC Office Proposal adapted for QoC from Pisano, 2015*)

**Pisano GP. You need an innovation strategy. Harv Bus Rev. 2015;2015(June).)*

Why and how on Global EHR?

- A global electronic health record (G-EHR) is achievable with focus, concrete steps, value creation and determination to explore certain elements.
- To reach a truly global digital healthcare system, however, we need to work much more profoundly and more decisively on real worldwide cross-border eHealth services, like a global ePrescription system or sharing of minimum sets of data (e.g. the ISO International Patient Summary) and progressively bigger components, such as a vaccination passport, summary or e-cards. For example, medical devices (e.g. insulin infusion pumps, or non-invasive home ventilators) are increasingly globally produced and standardised, yet, the information that they require and generate seems to get 'chained' to local, regional or national health systems, in turn, chaining citizens down to their institutions, often their homes. People fear to travel to a remote location where access to their device or health data is not possible. They know healthcare may not be equally safe, which makes them feel unsafe to travel and 'chained'.
- Digital Health Diplomacy refers to the concentrated international efforts towards supranational interoperability in eHealth/Digital Health. These may include international agreements for mutual health data transmission, recognition of information systems or common approaches to the use of international standards.

What is the Global EHR?

- A global electronic health record (G-EHR) is **a set of interconnected digital systems and services that support the sharing of personal health data across the globe** to support primary use of health data regardless of geographical, jurisdictional and language barriers creating an electronic health record support environment as similar as possible to that experienced by the individual and his/her caregivers in his home country. It is based on standards and is a de facto promotion of data harmonization leading up to a potential “Global Health Data Space” of nominal/anonymized health data for its potential secondary and tertiary use.
- A global electronic health record (G-EHR) is not something utopic. It requires focus, concrete steps, value creation and determination to explore the following elements.
 - 1) Creating a worldwide voluntary patient and health professionals’ registries
 - 2) Setting up a global regime/governance forum for the advancement of agreements and common creations
 - 3) Using a common exchange format (possibly inspired in the European EHR exchange format?)
- Source: H. Martins 2020:
<https://healthmanagement.org/c/healthmanagement/issuearticle/digital-health-diplomacy-in-chained-globalised-health-context>

Worldwide eHealth cross-border services

The following worldwide eHealth cross-border services serve as initial steps:

- 1) Global ePrescription system
- 2) **Global sharing of minimum sets of data** (for example, the ISO International Patient Summary) and, progressively, bigger components, such as vaccination passports/summary/e-cards
- 3) exploring Globally with the EU European EHRxFormat
- 4) Internationally approved **minimum information sets** for advanced data-rich medical devices
- 5) Internationally approved and maintained digital information leaflets for prescribed drugs.
- 6) International sharing of large datasets for research/public health based on Commonly agreed minimum sets of data

Global Treaty on Digital Health

Home / Programs / Advanced / Post-Graduate / Digital Health

Be a leader in the digital health transition.

Get an international view of the current situation in the area of Digital Health with the set of national and international knowledge. It provides a multiple perspective from personal / technical, intermediate and macro / strategic levels. It allows contact with the topic of digital health from the point of view of how projects are led and an entrepreneurial initiative can be developed.

Type Post-Graduate	Duration may to october 6 months	Schedule Thursday and Friday 6.00pm - 10.30pm

XpanDH About the Project News, Blog & Events Meet the team Partners Contact us

Expanding Digital Health through a pan-European EHRxF-based Ecosystem

XpanDH project supports an expanding ecosystem of individuals and organizations that are developing, experimenting and adopting the European Electronic Health Record Exchange Format (EHRxF) providing a crucial contribution to the European Health Data Space. It is a 2-year Coordination and Support Action financed by the Horizon Europe Framework Programme.

Part 3. Discussion

a. Discussion: Recommendations on the reimbursement of citizen / patient-facing health apps

draft recommendations for reimbursement of apps

1. **Govern** – Establish governance: who within the health authority is responsible for exploring and decision-making on assessment and reimbursement of health apps?
2. **Value** - Acknowledge **apps can do things that pills can't and vice versa**. Both in their own way potentially contribute to health, wellbeing and can impact citizen, patient, carer and overall burden of the health system. Assess both the positive value and potential adverse effects or risks of apps, whether integrated in hybrid care pathways or not, for your public health and health system, now and in the future. Examples may include advances in prevention, early diagnosis, patient self-management, treatment adherence, health literacy, health professional efficiency, cost-effectiveness, primary and secondary data. Adverse effects, for which assessment can be a mitigation, may span privacy and security, regulatory compliance, user engagement, disparities, and technology lifetimes.
3. **Focus** - Identify types of apps that can deliver this value for specific health issues in which care pathways and if applicable for which types of patients. Evaluate these apps for potential payment or reimbursement in these care pathways.
4. **Assess** – Establish a framework for assessing health apps through internal processes or outsourcing. Consider incorporating a trusted EU framework within your own additional national requirements, creating an accelerated more efficient assessment. Ensure the assessment results are easily accessible, also to patients and citizens (e.g. label in frequently used trusted sources).
5. **Create** - Create the environment in which apps can deliver value. Integrate properly evaluated high-quality health apps in care pathways to maximize their value and facilitate potential substitution or cost reduction. If the value requires a role of a health professional, fund that role. Facilitate and provide incentives for industry to deliver quality products, addressing present and future needs. Ensure that reimbursement rates consider added value, quality, societal benefits, investments needed to acquire the indicated evidence, sustained equitable use, seamless integration of app data in EHRs, etc. and enable further investments to meet future demands. Set up the needed infrastructure. Enable interoperability and safe data exchange between EHR systems and patient-facing health apps. Use standards.
6. **Fund** – Foster reimbursement of quality apps, making them part of a new normal and accessible to all. Allocate related funds, consider innovative payment models, and explore need for further policies.
7. **Specify** - Recognizing that if you judge an app by its ability to be a pill or vice versa we will believe either one is stupid, explore and communicate appropriate outcome measures and potentially also comparators (standard of care, if possible with an EU perspective, waiting list, other digital / hybrid care) and scope to consider (e.g. wider value of behaviour change and literacy) to capture the true value and thus make adequate decisions on initial and final reimbursement. Consider that beyond individual benefit, apps can progress societal benefit with the data they produce for secondary use.
8. **Enable** – Promote the education of health care professionals (medical school, post-graduate, Massive Open Online Courses, also by professional societies and manufacturers). This education should include how to analyse app data to safely capture the value of data in primary use and ultimately secondary use. Educate citizens and patients on benefits and risks associated with health apps and how to recognise trusted sources.
9. **Support** – Co-create a support role for patients and consumers similar to pharmacists for drugs and consumer organisations for consumer products, alongside efforts from manufacturers to create easy to use apps and of insurers and hcps to require and reward such ease of use. Involve professional societies to provide guidance for health professionals on how to identify apps to recommend and their recommended use, also in relation to other health interventions. Integrate this guidance in regular clinical guidelines.
10. **Measure** – Measure value transparently. Publish reports and explore what else needs to be arranged to capture the attainable value of health apps. Enable and incentivise such results. Realise that without quality apps, integrated in care pathways, users trained and resulting data being used, adequate outcome measures and ditto scope, etc. the measurements do not reflect attainable value.

recommendation 1: Govern

1. Govern – Establish governance: who within the health authority is responsible for exploring and decision-making on assessment and reimbursement of health apps?

recommendation 2: Value

2. Value - Acknowledge **apps can do things that pills can't and vice versa**. Both in their own way potentially contribute to health, wellbeing and can impact citizen, patient, carer and overall burden of the health system. Assess both the positive value and potential adverse effects or risks of apps, whether integrated in hybrid care pathways or not, for your public health and health system, now and in the future. Examples may include advances in prevention, early diagnosis, patient self-management, treatment adherence, health literacy, health professional efficiency, cost-effectiveness, primary and secondary data. Adverse effects, for which assessment can be a mitigation, may span privacy and security, regulatory compliance, user engagement, disparities, and technology lifetimes.

recommendation 3: Focus

University of Michigan, National poll on healthy ageing, 2022

3. Focus - Identify types of apps that can deliver this value for specific health issues in which care pathways and if applicable for which types of patients. Evaluate these apps for potential payment or reimbursement in these care pathways.

recommendation 4: Assess

GEN-ISO/TS 82304-2:2021

4. Assess – Establish a framework for assessing health apps through internal processes or outsourcing. Consider incorporating a trusted EU framework within your own additional national requirements, creating an accelerated more efficient assessment. Ensure the assessment results are easily accessible, also to patients and citizens (e.g. label in frequently used trusted sources).

recommendation 5: Create

5. Create - Create the environment in which apps can deliver value. Integrate properly evaluated high-quality health apps in care pathways to maximize their value and facilitate potential substitution or cost reduction. If the value requires a role of a health professional, fund that role. Facilitate and provide incentives for industry to deliver quality products, addressing present and future needs. Ensure that reimbursement rates consider added value, quality, societal benefits, investments needed to acquire the indicated evidence, sustained equitable use, seamless integration of app data in EHRs, etc. and enable further investments to meet future demands. Set up the needed infrastructure. Enable interoperability and safe data exchange between EHR systems and patient-facing health apps. Use standards.

recommendation 6: Fund

6. Fund – Foster reimbursement of quality apps, making them part of a new normal and accessible to all. Allocate related funds, consider innovative payment models, and explore need for further policies.

recommendation 7: Specify

7. Specify - Recognizing that if you judge an app by its ability to be a pill or vice versa we will believe either one is stupid, explore and communicate appropriate outcome measures and potentially also comparators (standard of care, if possible with an EU perspective, waiting list, other digital / hybrid care) and scope to consider (e.g. wider value of behaviour change and literacy) to capture the true value and thus make adequate decisions on initial and final reimbursement. Consider that beyond individual benefit, apps can progress societal benefit with the data they produce for secondary use.

recommendation 8: Enable

8. Enable – Promote the education of health care professionals (medical school, post-graduate, Massive Open Online Courses, also by professional societies and manufacturers). This education should include how to analyse app data to safely capture the value of data in primary use and ultimately secondary use. Educate citizens and patients on benefits and risks associated with health apps and how to recognise trusted sources.

recommendation 9: Support

9. Support – Co-create a support role for patients and consumers similar to pharmacists for drugs and consumer organisations for consumer products, alongside efforts from manufacturers to create easy to use apps and of insurers and hcps to require and reward such ease of use. Involve professional societies to provide guidance for health professionals on how to identify apps to recommend and their recommended use, also in relation to other health interventions. Integrate this guidance in regular clinical guidelines.

European Society
of Cardiology

mHealth Taskforce

recommendation **10**: Measure

10. Measure – Measure value transparently. Publish reports and explore what else needs to be arranged to capture the attainable value of health apps. Enable and incentivise such results. Realise that without quality apps, integrated in care pathways, users trained and resulting data being used, adequate outcome measures and ditto scope, etc. the measurements do not reflect attainable value.

b. Conclusion of all 3 roundtables

3rd roundtable on reimbursement and payment of patient / citizen-facing health apps –
February 13, 2024

draft recommendations for reimbursement of apps

1. **Govern** – Establish governance: who within the health authority is responsible for exploring and decision-making on assessment and reimbursement of health apps?
2. **Value** - Acknowledge **apps can do things that pills can't and vice versa**. Both in their own way potentially contribute to health, wellbeing and can impact citizen, patient, carer and overall burden of the health system. Assess both the positive value and potential adverse effects or risks of apps, whether integrated in hybrid care pathways or not, for your public health and health system, now and in the future. Examples may include advances in prevention, early diagnosis, patient self-management, treatment adherence, health literacy, health professional efficiency, cost-effectiveness, primary and secondary data. Adverse effects, for which assessment can be a mitigation, may span privacy and security, regulatory compliance, user engagement, disparities, and technology lifetimes.
3. **Focus** - Identify types of apps that can deliver this value for specific health issues in which care pathways and if applicable for which types of patients. Evaluate these apps for potential payment or reimbursement in these care pathways.
4. **Assess** – Establish a framework for assessing health apps through internal processes or outsourcing. Consider incorporating a trusted EU framework within your own additional national requirements, creating an accelerated more efficient assessment. Ensure the assessment results are easily accessible, also to patients and citizens (e.g. label in frequently used trusted sources).
5. **Create** - Create the environment in which apps can deliver value. Integrate properly evaluated high-quality health apps in care pathways to maximize their value and facilitate potential substitution or cost reduction. If the value requires a role of a health professional, fund that role. Facilitate and provide incentives for industry to deliver quality products, addressing present and future needs. Ensure that reimbursement rates consider added value, quality, societal benefits, investments needed to acquire the indicated evidence, sustained equitable use, seamless integration of app data in EHRs, etc. and enable further investments to meet future demands. Set up the needed infrastructure. Enable interoperability and safe data exchange between EHR systems and patient-facing health apps. Use standards.
6. **Fund** – Foster reimbursement of quality apps, making them part of a new normal and accessible to all. Allocate related funds, consider innovative payment models, and explore need for further policies.
7. **Specify** - Recognizing that if you judge an app by its ability to be a pill or vice versa we will believe either one is stupid, explore and communicate appropriate outcome measures and potentially also comparators (standard of care, if possible with an EU perspective, waiting list, other digital / hybrid care) and scope to consider (e.g. wider value of behaviour change and literacy) to capture the true value and thus make adequate decisions on initial and final reimbursement. Consider that beyond individual benefit, apps can progress societal benefit with the data they produce for secondary use.
8. **Enable** – Promote the education of health care professionals (medical school, post-graduate, Massive Open Online Courses, also by professional societies and manufacturers). This education should include how to analyse app data to safely capture the value of data in primary use and ultimately secondary use. Educate citizens and patients on benefits and risks associated with health apps and how to recognise trusted sources.
9. **Support** – Co-create a support role for patients and consumers similar to pharmacists for drugs and consumer organisations for consumer products, alongside efforts from manufacturers to create easy to use apps and of insurers and hcps to require and reward such ease of use. Involve professional societies to provide guidance for health professionals on how to identify apps to recommend and their recommended use, also in relation to other health interventions. Integrate this guidance in regular clinical guidelines.
10. **Measure** – Measure value transparently. Publish reports and explore what else needs to be arranged to capture the attainable value of health apps. Enable and incentivise such results. Realise that without quality apps, integrated in care pathways, users trained and resulting data being used, adequate outcome measures and ditto scope, etc. the measurements do not reflect attainable value.

recommendation 2: Value

2. Value - Acknowledge **apps can do things that pills can't and vice versa**. Both in their own way potentially contribute to health, wellbeing and can impact citizen, patient, carer and overall burden of the health system. Assess both the positive value and potential adverse effects or risks of apps, whether integrated in hybrid care pathways or not, for your public health and health system, now and in the future. Examples may include advances in prevention, early diagnosis, patient self-management, treatment adherence, health literacy, health professional efficiency, cost-effectiveness, primary and secondary data. Adverse effects, for which assessment can be a mitigation, may span privacy and security, regulatory compliance, user engagement, disparities, and technology lifetimes.

Digital Health and Care

TRANSFORMATION OF HEALTH AND CARE IN THE DIGITAL SINGLE MARKET - Harnessing the potential of data to empower citizens and build a healthier society

European health challenges

- Ageing population and chronic diseases putting pressure on health budgets
- Unequal quality and access to healthcare services
- Shortage of health professionals

Potential of digital applications and data to improve health

- Efficient and integrated healthcare systems
- Personalised health research, diagnosis and treatment
- Prevention and citizen-centred health services

What EU citizens expect..

- 90% agree** To access their own health data (requiring interoperable and quality health data)
- 80% agree** To share their health data (if privacy and security are ensured)
- 80% agree** To provide feedback on quality of treatments

#DigitalSingleMarket #DigitalHealth @eHealth_EU @EU_health

Support European Commission:

1 Secure access and exchange of health data

Ambition:

Citizens securely access their health data and health providers (doctors, pharmacies...) can exchange them across the EU.

Actions:

- eHealth Digital Service Infrastructure will deliver initial cross-border services (patient summaries and ePrescriptions) and cooperation between participating countries will be strengthened.
- Proposals to extend scope of eHealth cross-border services to additional cases, e.g. full electronic health records.
- Recommended exchange format for interoperability of existing electronic health records in Europe.

2 Health data pooled for research and personalised medicine

Ambition:

Shared health resources (data, infrastructure, expertise...) allowing targeted and faster research, diagnosis and treatment.

Actions:

- Voluntary collaboration mechanisms for health research and clinical practice (starting with 'one million genomes by 2022' target).
- Specifications for secure access and exchange of health data.
- Pilot actions on rare diseases, infectious diseases and impact data.

3 Digital tools and data for citizen empowerment and person-centred healthcare

Ambition:

Citizens can monitor their health, adapt their lifestyle and interact with their doctors and carers (receiving and providing feedback).

Actions:

- Facilitate supply of innovative digital-based solutions for health, also by SMEs, with common principles and certification.
- Support demand uptake of innovative digital-based solutions for health, notably by healthcare authorities and providers, with exchange of practices and technical assistance.
- Mobilise more efficiently public funding for innovative digital-based solutions for health, including EU funding.
